Business Name Coolidge Terminal Type Occupancy Industrial
Stories 2+UB Construction Masonary Person Contacted & Title Arthur Davis-District SRV
Owner City of Detroit Address 5300 Chrysler dr. Det, MI 48211
Occupant City of Detroit Address 5300 Chrysler dr. Det, MI 48211

Details of Investigation Upon Arriving I made contact with Arthur Davis-District Supervisor, Ken Ong - Building Maintenance. After speaking with both on the phone, Mr Raymond Chermult from Bldg facilities arrived and accompanied me during the inspection. The Alarm system is in working order and recently updated. A violation was issued for testing the sprinkler system, compiling and keeping the records on site. No testing was conducted due to poor condition of inspectors test valve and gauges seem to be seized a follow-up will be needed

ANSWER ALL QUESTIONS

1. Type(s) of product released: Diesel

2. Free product present:

a. Currently? YES NO

If YES, total gallons recovered since last report: 1.19

b. Previously? YES NO

If YES, total gallons recovered to date: 1.19

3. Have vapors been identified in any confined spaces (basement, sewers)? YES NO

4. Estimated depth to groundwater: 4 feet

Estimated groundwater flow direction: radial

5. Estimated distance and direction from point of release to nearest:

a. Private well: > 1/2 Mile

b. Municipal well: > 1/2 Mile

c. Surface water/wetland: Detroit River, > 1Mile South

6. Since last report: a. cubic yards of soil remediated: 1,520

b. gallons of groundwater remediated: 0

7. Totals to date: a. cubic yards of soil remediated: 6,260

b. gallons of groundwater remediated: 2,800

8. Michigan RBCA Site Classification (1-4): 1

9. Has contamination migrated off-site above Tier 1 Residential RBSLs YES NO

If YES, have off-site impacted parties been notified (per Section 21309a(3) of Part 213 YES NO

10. MTBE

Has MTBE been detected in any groundwater sample?

YES NO

Maximum MTBE concentration found in groundwater

39 ppb.

CERTIFICATION OF REPORT COMPLETION

I, the undersigned CP, hereby attest to the best of my knowledge and belief that the statements in this document and all attachments are true, accurate, and complete. I certify that the report was submitted to the Remediation & Redevelopment Division (RRD)

FREE PRODUCT RECOVERY STATUS REPORT

Authorized by Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Act 451).

INSTRUCTIONS: Use the checklist below to ensure that all required information is provided in the Quarterly Free Product Recovery Status Report and submit WITH THE SUPPLEMENTAL REPORT COVER SHEET (EQP3849) to the appropriate Remediation & Redevelopment Division (RRD) district office. See form eqp4410 for a complete list of RRD district offices. Include this checklist as a table of contents. Each page of the report should be consecutively numbered. The location column should be completed with the appropriate page number for each item. Refer to Storage Tank Division Operational Memorandum No. 7 for further instructions. The reporting schedule may be altered at the discretion of the DEQ project manager based on site conditions.	FACILITY ID NUMBER: <div style="text-align: center;">00013464</div> <hr/> SITE NAME: <div style="text-align: center;">Detroit Department of Transportation</div> <hr/> COUNTY: <div style="text-align: center;">Wayne</div>
---	---

Section	Table of Contents	Page
1.0	<u>ACTIVITIES COMPLETED</u> Section 21307(2) and (3)(b),(c) A. Describe response activities completed to address free product.	1
2.0	<u>EXPOSURE PATHWAY EVALUATION</u> Section 21307(2)(a),(e) and (3)(c) A. Identify and describe complete exposure pathways related to the free product. B. Provide a scaled site map, which shows the extent of free product including the utility corridors, buildings with or without basements, private wells, and sensitive habitat/surface water.	2 1, Figure 1
3.0	<u>DATA TREND ANALYSIS</u> Section 21307(2)(c)(i),(ii) and (3)(c) A. Provide a data summary table for all wells that contain free product. The table should include monitoring point location, date sampled, depth to water, free product thickness, and quantity of free product removed. B. Provide graphs of static water elevations of a well near the free product plume versus free product apparent thickness compared over time. These graphs should be provided for all monitoring wells that have shown free product. C. Provide graphs of static water elevations versus groundwater concentration (e.g., Benzene, MTBE, and/or total BTEX) in select downgradient monitoring wells compared over time.	2, Table 1 2, Graph 1 NA
4.0	<u>FEASIBILITY ANALYSIS ON SELECTION OF RECOVERY SYSTEM</u> Section 21307(2)(c)(i),(ii) and (3)(c), and 21308a(1)(b)(xviii) A. Provide initial and any subsequent bail-down test recovery data, analysis of which will determine the frequency of recovery. Refer to the references in Storage Tank Division Operational Memorandum No. 7 for sample calculations. B. Attach a schematic drawing of the free product recovery system.	2, Graph 2 2
5.0	<u>PERMITTING AND WASTE DISPOSAL TRACKING</u> A. Provide copies of manifests or trip logs of liquid industrial waste or recycling per Section 21307(2)(c)(iii) and (3)(c), and 21308a(1)(b)(xvii)(H). B. Provide the air quality sampling results and calculations to meet Rule 290 of the Air Pollution Control Rules promulgated under Part 55, Air Pollution Control, of Act 451.	2 2
6.0	<u>OPERATION AND MAINTENANCE RECOVERY DATA</u> Section 21307(2)(c)(i),(ii) and (3)(c) A. Describe any free product system design modifications, since last submittal. B. Provide the action levels that may trigger a change in remediation strategy.	2 2
7.0	<u>PROPOSED FUTURE ACTIONS</u> Section 21307(2)(e) and Section 21309a(2)(e) A. Provide a schedule for free product evaluation and groundwater sampling. B. Provide a schedule outlining the next operation and maintenance activities. C. Provide the date of the next report.	3 3 3

**QUARTERLY FREE PRODUCT REPORT
DETROIT DEPARTMENT OF TRANSPORTATION
COOLIDGE FACILITY NO. 00013464
14044 SCHAEFER HWY., DETROIT, MICHIGAN**

FREE PRODUCT DISCOVERY, IMMEDIATE RESPONSE, AND REPORTING

Free Product Discovery

During a groundwater sampling event conducted on April 16, 2003, free product was discovered in monitor well MW-15 (refer to the attached Site Sketch for location) at the site.

Immediate Response Activities

Approximately 1.08 inches of free product thickness was measured and 0.05 gallons of free product were removed from MW-15 (refer to Table 1 for free product elevation data and removal quantities). The free product was removed from MW-15 by hand bailing using a disposable bailer and containerized in a 55-gallon steel DOT approved drum that was properly labeled and stored on-site. Existing monitor wells on- and off-site were gauged during the sampling event and free product was not present in any other monitor wells. In addition, the site was surveyed for possible fire, explosion, and vapor hazards. The results of the survey indicated that no fire, explosion, or vapor hazards were present.

Reporting

The Michigan Department of Environmental Quality (MDEQ) was notified within 24-hours by fax transmittal using the MDEQ Free Product Fax Transmittal form.

Following the May 15, 2003, site visit, monthly site visits have been continued to date. A monthly site visit was conducted on June 26, 2003 to gauge apparent free product thickness and perform free product recovery.

FREE PRODUCT REMOVAL ACTIVITIES

After the discovery of free product in MW-15, the site was monitored for free product on a weekly basis for one month. Since the quantity of free product removed was consistent, the frequency of the free product site monitoring visits was revised to monthly.

Field data obtained from the first monthly (June 26, 2003) free product site monitoring visit indicated a slight increase in free product thickness but not a significant increase. Based on this information, the frequency of free product monitoring site visits will continue monthly and free product recovery will be performed by hand-bailing techniques.

The next monthly free product site monitoring visit is scheduled for July 25, 2003. During the site visit, the existing nearby monitor wells on- and off-site will be screened. If it is determined that the quantity or thickness of free product has significantly increased

or free product is discovered in other monitor wells, the current free product recovery method will be revised to an active recovery system.

EXPOSURE PATHWAY EVALUATION

Exposure pathways applicable to the site are consistent with the Final Assessment Report (FAR).

FREE PRODUCT DELINEATION

An Amended FAR is in the process of being completed for submittal to the MDEQ by the end of July 2003. Free product will be delineated during the installation of the proposed remediation system (as summarized in the Corrective Action Plan of the Amended FAR). A summary of the free product delineation activities and results will be presented in the next Quarterly Free Product Report (October 15, 2003).

DATA TREND ANALYSIS

Free product elevation data, apparent free product thickness, and quantity of free product removed from April 16, 2003 through June 26, 2003 is presented in Table 1. Graph 1 depicts the static water level elevations of MW-15 versus the apparent free product thickness over time. Graph 2 depicts the results of a free product bail-down test performed at MW-15

FEASABILITY ANALYSIS ON SELECTION OF RECOVERY SYSTEM

On April 17, 2003, a bail-down test was performed at MW-15. The bail-down test recovery data for MW-15 is provided on Graph 2. Based on the free product thickness and quantity encountered since June 26, 2003, monthly free product monitoring and recovery by hand-bailing method is appropriate. However, if the results of the free product delineation activities or monthly free product site monitoring indicate an unstable or increasing free product plume, then the current recovery system will be immediately revised to stabilize and reduce the plume.

PERMITTING AND WASTE DISPOSAL TRACKING

Free product recovered from MW-15 to date (a total of 1.19 gallons) was placed in a properly labeled, DOT approved, 55-gallon drum, and stored on-site.

Air quality sampling and calculations are not deemed necessary at this time since the free product is recovered by hand-bailing using a disposable bailer.

PROPOSED FUTURE ACTIONS

Monthly Free Product Monitoring

Monthly free product monitoring and recovery will continue.

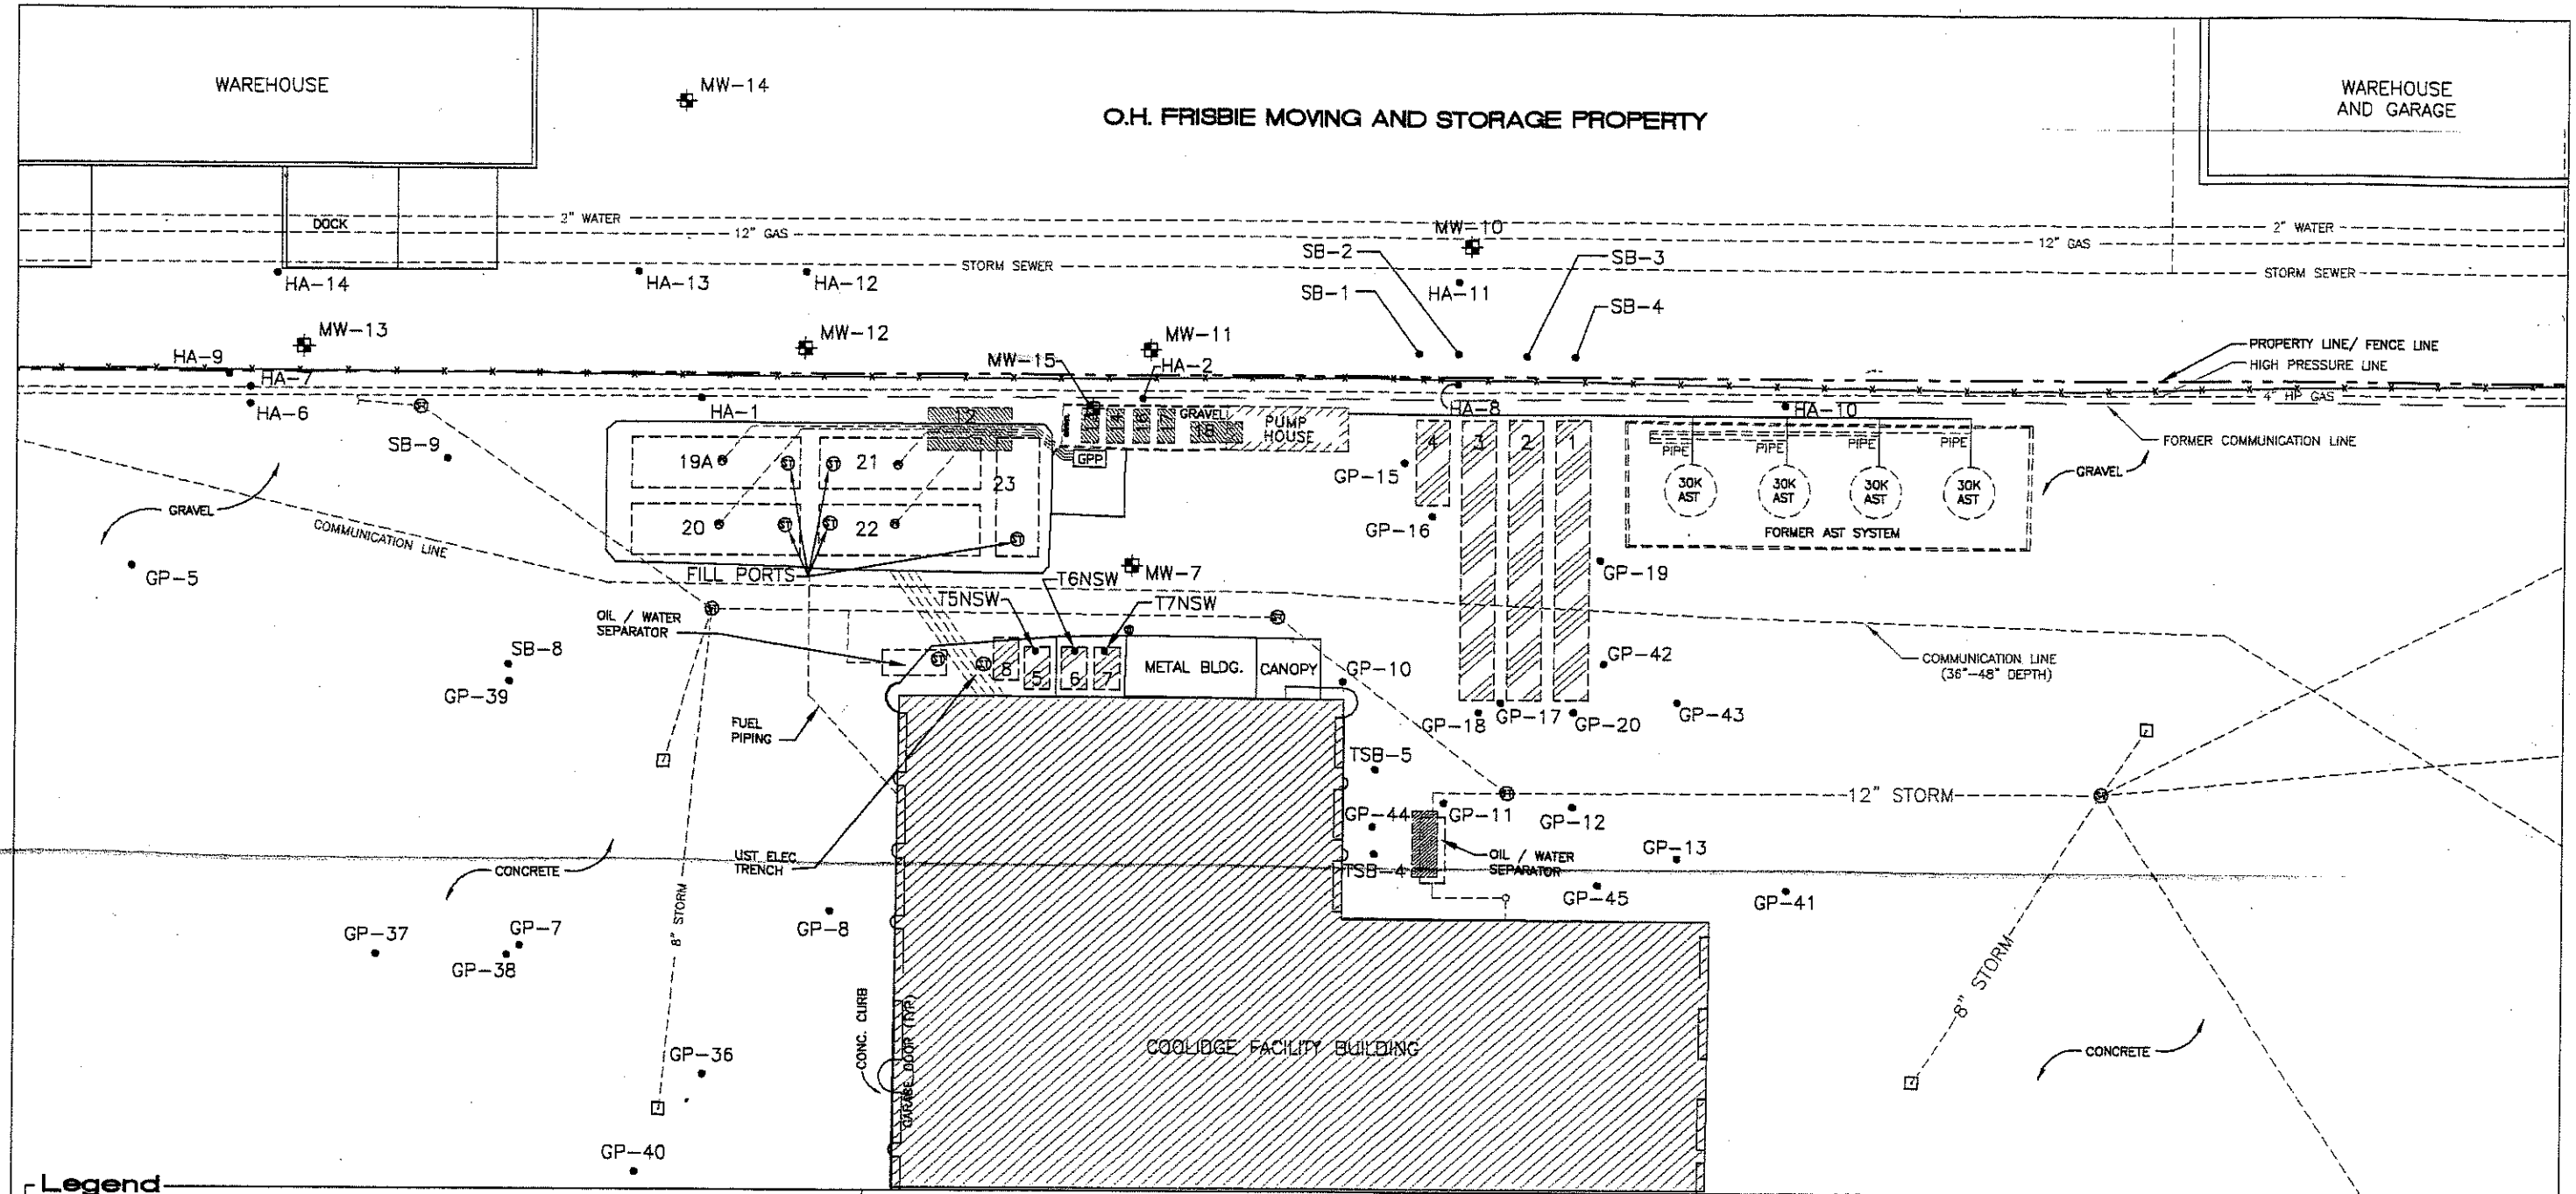

Free Product Delineation Activities

The free product plume will be delineated during the installation of the remediation system. The results will be included in the next Quarterly Free Product Report.

Next Quarterly Free Product Report

The next Quarterly Free Product Report will be submitted to the MDEQ on or before October 15, 2003.

MICHIGAN DEPARTMENT OF ENVIRONMENTAL QUALITY - STORAGE TANK DIVISION
INITIAL ASSESSMENT REPORT (Continued)

Instructions - Utilize the following checklist to ensure that all required information is provided in the Initial Assessment Report (IAR). Include this checklist as the table of contents. The order in which the information is provided is at your discretion. Each page of the report (including the cover sheet, table of contents, appendices, figures, etc.) should be consecutively numbered. The location column should be completed with the appropriate page number for each item. You may reference previously submitted materials by specifying the location within that document. Maps, tables, figures, etc. should be combined as appropriate.

All information required by Part 213 to be included in the IAR **must** be provided, and all sections of the report must be completed. If any items are not applicable to the site, provide a justification regarding the absence of this information in the appropriate section of the report.

Section	Table of Contents	Page
1.0	<u>INITIAL RESPONSE TO RELEASES</u>	
A.	Provide the date and time the release(s) was/were discovered and reported.	10
B.	Indicate what portion of the underground storage tank (UST) system is, or is believed to be, the source of the release.	10
C.	Describe how the release was discovered.	11
D.	Describe any tank tightness testing performed in response to this release and provide the following:	11
	1. Date of the testing	
	2. Method of testing	
	3. Results of the testing	
E.	List all former and existing USTs at this facility including the following information for each of these tanks:	11
	1. Tank ID Number (as registered)	
	2. Contents (past/present, if gasoline specify grade and whether leaded or unleaded)	
	3. Size of the UST	
	4. Whether the tank was identified as a leaking underground storage tank (LUST)	
	5. Whether the tank has been emptied and/or removed. If a LUST, provide an explanation if not emptied or removed	
F.	Describe the initial response actions which were performed at this site, as specified in Sections 21307(2)(a) through (c), and (3)(a) and (b).	12
2.0	<u>REPORTING AND RESPONSE FOLLOWING THE DISCOVERY OF FREE PRODUCT</u>	
	If free product has not been discovered, proceed to Section 3.0.	
A.	Describe initial response actions performed at this site to address the presence of free product as specified in Sections 21307(2)(c) and (f), and (3)(b) and (c), 21308a(1)(b)(xviii). Refer to the STD Operational Memorandum No. 7, <i>Identification, Reporting, and Recovery of Free Product at LUST Sites</i> .	12
B.	Attach the STD Free Product Recovery Status Report (EQP 3850).	12
C.	Include a schedule for subsequent Free Product Report submittals.	12

Section	Table of Contents	Page
3.0	<u>SITE CHARACTERIZATION INFORMATION</u>	
3.1	SCALED SITE MAPS	
A.	Provide a scaled area map (or maps) which includes the following:	
1.	Site boundaries in relation to the surrounding area and the nearest major roads	12
2.	Location and depth of nearby underground sewers and utility lines	Figure 2
3.	Location of nearby surface waters or wetlands	Figure 1
4.	Location and screened depth of all off-site wells (municipal, residential, production, irrigation, etc.) within two years groundwater travel time of the property line, which may be dependent on the pumping rates of the identified well(s)	NA
5.	Location of all nearby delineated well-head protection areas	NA
B.	Provide a scaled site map (or maps) which includes the following:	
1.	Location of fill ports, piping, dispensers, and other pertinent system components for all UST systems currently or formerly at the facility (<i>prior to excavation if tanks have been removed</i>)	Figure 2
2.	Location of the release and the component of the LUST system from which the release occurred	13
3.	Location of adjacent buildings, roadways, paved areas, or other structures	Figure 2
4.	Location of all on-site wells and screened intervals	Figure 2
5.	Location of soil, groundwater, surface water, sediment or air samples, as applicable	Fig. 3,4,5
6.	Excavation dimensions and sample locations if applicable	Fig. 3,4,5
3.2	SCALED CROSS-SECTIONAL DIAGRAMS	13
A.	Provide scaled cross-sectional diagrams of buried utility corridors, including the pipe diameter, the type of backfill, and the trench depth.	NA
B.	Provide scaled cross-sectional diagrams depicting the soil lithology and the contaminant distribution, including sampling intervals and boring depths.	NA
C.	Provide scaled cross-sectional diagrams depicting the site hydrogeology, including the groundwater potentiometric surface, the monitoring well screened intervals, and sampling intervals.	NA
3.3	SOIL CONDITIONS AND CHARACTERISTICS	
A.	Describe the soils encountered in the vadose zone.	14
B.	Describe any soil contamination which has been detected.	14
C.	Describe any soil remediation or disposal activities performed to date, including the total volume of soil remediated or disposed. Indicate the disposal location, and provide proof of disposal (e.g., invoices, not load tickets).	17

Section	Table of Contents	Page
D.	Provide a site diagram which identifies the estimated horizontal and vertical extent of on-site and off-site soil contamination. Include the maximum concentrations and sample depths.	17
E.	Provide an estimate of the volume of impacted soil remaining in the vadose zone.	17
F.	Describe steps that have been taken, or will be taken, to secure access to <u>off-site</u> properties, including easements and right-of-ways, to complete the delineation of the extent of the <u>off-site</u> impact of the release to soil. Include the names and addresses of potentially affected off-site property owners.	18
G.	Provide the schedule for completing the delineation of the extent of the <u>off-site</u> impact of the release to soil.	18
H.	Provide a table with field screening and laboratory data showing the results of all soil sampling performed to date for the required parameters. Refer to the STD Operational Memorandum No. 14 <i>Analytical Parameters and Methods, Sample Handling, and Preservation for Petroleum Releases</i> .	Tables 1, 2a & 2b
	<ol style="list-style-type: none"> 1. Sample ID 2. Sample depth 3. Date of collection 4. Dates of extraction and analysis 5. Method Detection Limits 6. Analytical method or field screening instrument 	
	<i>(NOTE: The STD may request copies of the laboratory data sheets, chain-of-custody forms, and all available QA/QC information.)</i>	
I.	Provide a table which compares the maximum remaining soil contaminant concentrations for each required parameter to the appropriate RBSLs as provided in STD Operational Memorandum No. 4 <i>Tier I Lookup Tables for Risk-Based Corrective Action at Leaking Underground Storage Tank Sites</i> . If residential leaching to groundwater RBSLs are not utilized for comparison, provide an explanation.	19
J.	Provide soil boring logs.	19
K.	Identify any known soil contamination not related to the release and the source, if known.	NA
3.4 GROUNDWATER CONDITIONS AND CHARACTERISTICS		
A.	Describe the site hydrogeology, and include the following:	
	<ol style="list-style-type: none"> 1. Depth to groundwater and method of determination 2. Whether the groundwater is potable and/or not in an aquifer. Provide the basis for this determination. Refer to STD Operational Memorandum No.11 <i>Criteria to Eliminate the Potable Groundwater Pathway</i>. 	20
		20

Section	Table of Contents	Page
	3. Whether the groundwater is currently used as a source of drinking water, either residential or municipal	20
	4. Whether groundwater is being used for a purpose other than drinking water	20
	5. Whether more than one groundwater unit is present beneath the site	20
	6. Depth to bottom of water-bearing layer	NA
	7. Predominant soil type in water-bearing stratum (e.g., sand, silt)	20
	8. Effective porosity of water-bearing stratum (in $\text{cm}^3_{\text{void}}/\text{cm}^3_{\text{matrix}}$), and describe how it was determined	NA
	9. Hydraulic conductivity, and describe how it was determined	NA
	10. Groundwater flow rate and direction	NA
	11. Lateral component of the hydraulic gradient	NA
	12. Hydrogeologic conditions that could influence flow direction	NA
	13. Magnitude and direction of the vertical component of the hydraulic gradient	NA
B.	Attach copies of the following:	
	1. Boring logs	Attach. A
	2. Well construction diagrams	NA
	3. Potentiometric surface map	NA
	4. Elevation data (USGS datum preferred), including top-of-casing, and grade elevations, and depth to groundwater	NA
C.	Provide scaled maps and cross-sectional diagrams, showing the screened and/or sampling interval, which depict the extent of impact and the maximum concentrations.	Fig. 4
D.	Indicate whether more than one groundwater unit has been impacted.	NA
E.	Describe any groundwater remediation activities performed to date, including the total volume of groundwater remediated and the disposition of this groundwater.	NA
F.	Provide an indication of whether the plume currently extends off-site.	21
G.	Describe steps that have been taken, or will be taken, to secure access to <u>off-site</u> properties, including easements and right-of-ways, for the purpose of completing the delineation of the extent of the release to groundwater, and provide the names and addresses of off-site property owners.	21
H.	Provide the schedule for completing the delineation of the extent of the off-site impact of the release to groundwater.	21
I.	Provide a table with field screening and laboratory data showing the results of all groundwater sampling performed to date for the required parameters. Refer to the STD Operational Memorandum No. 14. The table should include the following:	
	1. Sample ID	
	2. Sample depth and/or screened interval	
	3. Date of collection	
	4. Dates of extraction and analysis	
	5. Method Detection Limits	Table 3

Section	Table of Contents	Page
	6. Analytical method or field screening instrument	
	<i>(NOTE: The STD may request copies of the laboratory data sheets, chain-of-custody forms, and all available QA/QC information.)</i>	
	J. Provide a table which compares the maximum remaining groundwater contaminant concentrations for each required parameter to the appropriate RBSLs as provided in STD Operational Memorandum No. 4. If residential health-based/aesthetic drinking water criteria are not utilized for comparison, provide an explanation.	Table 4
	K. Identify any known groundwater contamination not related to the release and the source, if known.	NA
3.5	CONDITIONS AND CHARACTERISTICS IN OTHER ENVIRONMENTAL MEDIA	
	A. Describe the evaluations conducted to determine if other environmental media have been impacted.	NA
	B. Describe the extent and distribution of any contamination present in any environmental media other than soil or groundwater.	NA
	C. Describe any actions taken or planned in response to contamination in other environmental media.	NA
	D. Describe steps that have been taken, or will be taken, to secure access to <u>off-site</u> properties, including easements and right-of-ways, to complete the delineation of the extent of the <u>off-site</u> impact of the release to the other specified environmental media. Provide names and addresses of potentially affected off-site property owners.	NA
	E. Provide a schedule for completing the delineation of the extent of the <u>off-site</u> impact of the release to the other specified environmental media.	NA
	F. Provide a table with the field screening and laboratory data showing the results of all sampling performed to date in the other specified environmental media.	NA
	<i>(NOTE: The STD may request copies of the laboratory data sheets, chain-of-custody forms, and all available QA/QC information.)</i>	
	G. Identify any known contamination in the other specified media not related to the release, and the source if known.	NA
4.0	<u>SITE CLASSIFICATION</u>	
	A. Indicate the current Site Classification Level, in accordance with STD Operational Memorandum No. 5, <i>Leaking Underground Storage Tank (LUST) Site Classification System</i> .	22

Section	Table of Contents	Page
---------	-------------------	------

B. Provide a justification for this classification. Identify the current conditions that are the basis of the classification, and dates that the prescribed initial response actions were implemented.	<u>22</u>
--	-----------

5.0 RESULTS OF THE RBCA EVALUATION

5.1 EXPOSURE PATHWAY CHARACTERIZATION

A. Identify and describe the following (Figure 2, <u>Exposure Scenario Evaluation Flowchart</u> , provided in the <i>ASTM RBCA E 1739-95</i> , may be utilized):	
1. Potential source(s)	<u>22</u>
2. Potential transport mechanism(s)	<u>22</u>
3. Potential exposure routes(s)	<u>22</u>
4. Potential receptor(s)	<u>22</u>
B. List each possible exposure pathway(s) for each land use, and sensitive habitat (if applicable) for the site. Provide an explanation for eliminating any pathways.	<u>23</u>

NOTE: A complete pathway must include three necessary elements:

- 1) a source (e.g., contamination);*
- 2) a mechanism by which the contamination can become available to result in exposures at the source or via migration to other locations (e.g., free product and contaminated groundwater movement along a buried utility corridor); and*
- 3) an individual who may come into contact, ingest, or inhale the contamination at the point of exposure (e.g., a utility maintenance worker digging to repair the line).*

Examples of a complete pathway include:

- 1) inhalation of impacted soils by an on-site construction worker*
- 2) impacted soils leaching into potable ground water and being used by a nearby resident for drinking and bathing*
- 3) inhalation of vapors resulting from the migration of free product by a neighboring industrial worker*
- 4) impacted groundwater discharging to wetlands.*

5.2 OPTIONAL TIER II EVALUATION

A. Indicate whether a site-specific Tier II or evaluation has been conducted for this site.	<u>NA</u>
B. If applicable, identify and justify where alternate assumptions or site-specific information were used in place of the default assumptions as defined in the STD Operational Memorandum No. 4.	<u>NA</u>
C. Provide the calculations and reference citations supporting the development of the relevant Tier II SSTLs.	<u>NA</u>

Section	Table of Contents	Page
---------	-------------------	------

- D. Provide a table which compares the maximum remaining contaminant concentrations for each required parameter for all media to the appropriate RBSLs (as provided in the STD Operational Memorandum No. 4), and the calculated SSTLs. Identify all applicable land use scenario(s), and indicate whether or not there is an exceedance of the RBSLs or the SSTLs.

NA

5.3 PROPOSED FOLLOW-UP ACTIVITIES

- A. Based on the results of the Tier I or optional Tier II evaluation, indicate the follow-up activities proposed for the site, (e.g., site closure; interim corrective action with subsequent reevaluation; final corrective action to achieve Tier I RBSLs or Tier II SSTLs; or perform further site-specific Tier II or Tier III evaluation to establish alternative SSTLs that meet the target risk goals).

24

- B. Provide justification for the option chosen.

24

- C. Provide a Work Plan and implementation schedule that describes the proposed site characterization activities to be performed to determine the horizontal and vertical extent of contamination. Include a scaled site map depicting proposed sampling locations.

24

1.0 INITIAL RESPONSE TO RELEASES

A. Provide the date and time the release(s) was/were discovered and reported.

Confirmed Release Number	Date & Time Discovered	Date & Time Reported	Substance Released	Location of Release (Figure 2)
C-1332-99	12/20/99 9:00 am	12/20/99 9:40 am	Engine Oil & Gasoline	Piping associated with Tank No. 9, 10, & 19
C-1333-99	12/20/99 12:40 pm	12/20/99 2:34 pm	Gasoline	Piping associated with Tank No. 12
C-1388-99	12/30/99 12:00 pm	12/30/99 2:53 pm	Residual Oils & Diesel	Area of closed-in-place Tank No. 5, 6, 7, & 8 and Tank No. 14, 16, & 18.
C-88-00	1/25/00 2:09 pm	1/26/00 10:08 am	Diesel	Area of closed-in-place Tank No. 1, 2, & 3

B. Indicate what portion of the underground storage tank (UST) system is, or is believed to be, the source of the release.

Confirmed Release No. C-1332-99 and C-1333-99:

During UST removal activities, the source of the engine oil & gasoline releases appeared to be from the associated product piping of Tank No. 9, 10, 12, and 19.

Confirmed Release No. C-1388-99:

During the removal of Tank No. 13, 14, 16, and 18, corrosion holes were observed on the bottom of the tanks. The source of the diesel release is believed to be the tanks.

During Geoprobe® drilling, elevated photoionization detection (PID) readings were detected from soil samples collected in the immediate vicinity of closed-in-place Tank No. 5, 6, 7, and 8. It is unknown what portion of the UST system is the source of the residual oil release.

Confirmed Release No. C-88-00:

Laboratory analytical results from soil samples collected during Geoprobe® drilling in the immediate vicinity of the closed-in-place Tank No. 1, 2, and 3 indicated that elevated contaminate concentrations were detected. It is unknown what portion of the UST system is the source of the diesel release.

C. Describe how the release was discovered.

Confirmed Release No. C-1332-99 and C-1332:

A confirmed release was reported based on stained soils, petroleum odor, and elevated PID readings detected during the removal of Tank No. 9, 10, 12, and 19.

Confirmed Release No. C-1388-99:

A confirmed release was reported based on petroleum odor and elevated PID readings detected during Geoprobe® drilling activities in the immediate vicinity of closed-in-place Tank No. 5, 6, 7, and Tank No. 8, 13, 14, 16, and 18.

Confirmed Release No. C-88-00:

A confirmed release was reported based on the analytical results from soil samples collected during Geoprobe® drilling in the immediate vicinity of closed-in-place Tank No. 1, 2, and 3

D. Describe any tank tightness testing performed in response to this release and provide the date of testing, method of testing, and results of testing.

Not Applicable. Each of the USTs at the subject site were removed or closed-in-place. Therefore, tank tightness testing was not necessary.

E. List all former and existing USTs at the facility.

Tank ID Number (As Registered)	Tank Capacity (gallons)	Contents (Regulated Substance)	Was the tank identified as a LUST?	Has the tank been emptied (Date)?	Has the tank been removed or closed-in-place (Date)?
1	50,000	Diesel	No	Yes, 12/30/99	Closed-in-place, 1/5/00
2	50,000	Diesel	No	Yes, 12/22/99	Closed-in-place, 12/22/99
3	50,000	Diesel	No	Yes, 12/30/99	Closed-in-place, 1/4/00
4	12,000	Gasoline	No	Yes, 12/29/99	Closed-in-place, 1/4/00
5	1,000	Engine Oil	No	Yes, 12/21/99	Closed-in-place, 12/22/99
6	1,000	Engine Oil	No	Yes, 12/21/99	Closed-in-place, 12/22/99
7	1,000	Converter Oil	No	Yes, 12/21/99	Closed-in-place, 12/22/99
8	1,000	Dextron	No	Yes, 1/4/00	Closed-in-place, 1/4/00
9	20,000	Engine Reserves	No	Yes, 12/20/99	Yes, Removed 12/20/99
10	20,000	Engine Reserves	No	Yes, 12/20/99	Yes, Removed 12/20/99
11	1,500	Waste Oil	No	Yes, 12/22/99	Closed-in-place, 12/22/99
12	12,000	Gasoline	No	Yes, 12/21/99	Yes, Removed 12/21/99
14	500	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
15	500	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
16	500	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
17	500	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
18	1,000	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
19	20,000	Gasoline	No	Yes, 12/23/99	Yes, Removed 12/23/99

F. Describe the initial response actions which were performed at this site, as specified in Sections 21307(2)(a) through (c), and (3)(a) and (b).

In December 1999, during UST closure activities, the site was surveyed for possible fire, explosion, and vapor hazards. No fire, explosion, or vapor hazards were readily observed at the subject site.

2.0 REPORTING AND RESPONSE FOLLOWING THE DISCOVERY OF THE FREE PRODUCT

A. Describe initial response actions performed at this site to address the presence of free product as specified in Sections 21307(2)(c) and (f), and (3)(b) and (c), 21308a (1)(b)(xviii). Refer to the STD Operational Memorandum No. 7, Identification, Reporting, and Recovery of Free Product at LUST Sites.

Not Applicable. Free product has not been encountered at the site.

B. Attach the USTD Free Product Recovery Status Report (EQP 3850).

Not Applicable.

C. Include a schedule for subsequent Free Product Report Submittals.

Not Applicable.

3.0 SITE CHARACTERIZATION INFORMATION

3.1 SCALED SITE MAPS

A. Provide a scaled area map (or maps) which includes the following: site boundaries in relation to the surrounding area and the nearest major roads, location and depth of nearby underground sewers and utility lines; location of nearby surface waters or wetlands, location and screened depth of all off-site wells (municipal, residential, production, irrigation, etc.) within two years groundwater travel time of the property line; and location of all nearby delineated well-head protection areas.

Site boundaries in relation to the surrounding area and the nearest major roads and nearby surface waters are presented on Figure 1, Area Location Map. A water well search within a ½ mile radius of the site was conducted through the MDEQ Lansing office. Results of the water well search indicated that no water well records were located within a ½ mile radius of the subject site. In addition, the City of Detroit ordinance will not allow for the installation of a water supply well.

According to the MDEQ World Wide Web (www) page, a delineated well-head protection area map for Wayne County is currently under preparation and not available at this time.

B. Provide a scaled area map (or maps) which includes the following: location of fill ports, piping, and dispensers, and other pertinent system components for all UST systems currently or formerly at the facility (prior to excavation if tanks have been removed); location of the release and the component of the LUST system from which the release occurred; location of adjacent buildings and roadways, paved areas, or other structures; location of all on-site wells and screened intervals; location of soil and groundwater samples; and excavation dimensions with sample locations.

The location of the UST fill ports are presented on Figure 2. Also illustrated on Figure 2 are the adjacent properties, roadways, paved areas, site buildings, and site structures. Sample locations, UST excavation dimensions, and maximum soil concentrations are presented on Figures 3, 4, and 5.

Upon completion of the installation of monitor wells (as proposed in Section 5.3 C), a maximum groundwater concentration figure will be prepared and presented to the MDEQ in the Final Assessment Report (FAR).

3.2 SCALED CROSS-SECTIONAL DIAGRAMS

A. Provide scaled cross-sectional diagrams of buried utility corridors, including the pipe diameter, the type of backfill, and the trench depth.

Not available at this time. The City of Detroit Water & Sewage Department will be contacted for any available maps depicting the location and depth of buried utility corridors on or near the subject site. If available, a scaled cross-sectional diagram of the buried utility corridors will be prepared and submitted to the MDEQ upon completion of the proposed site investigation (see Section 5.3 C).

B. Provide scaled cross-sectional diagrams depicting the soil lithology and the contaminant distribution, including sampling intervals and boring depths.

A cross-sectional diagram of the soil lithology and contaminant distribution, including sampling intervals and boring depths will be prepared and presented to the MDEQ upon completion of the proposed site investigation (see Section 5.3 C).

C. Provide scaled cross-sectional diagrams depicting the site hydrogeology, including the groundwater potentiometric surface, the monitoring well screened intervals, and sampling intervals.

A cross-sectional diagram of the site hydrogeology, including the groundwater potentiometric surface, monitoring well screened intervals, and sampling intervals will also be prepared and presented to the MDEQ upon completion of the proposed site investigation (see Section 5.3 C).

3.3 SOIL CONDITIONS AND CHARACTERISTICS

A. Describe soil encountered in the vadose zone.

Soil encountered at the site during UST closure and Geoprobe® drilling activities consisted of fill material (brown, fine-grained sand) ranging in depths from 0 to 6 feet below ground (bg). Underlying the fill material was clay ranging in depths from 2 to 16 feet bg, total depth explored. However, in soil borings GP-15, GP-16, GP-18, GP-19, and GP-20 fill material was encountered from 0 to 16 feet bg. Soil boring logs are included in Attachment A.

B. Describe any soil contamination which has been detected.

Closed-In-Place Diesel and Gasoline Aqua System USTs

On January 5, 2000, six soil borings were advanced using a Geoprobe® in the vicinity of the closed-in-place diesel aqua system USTs (Tank No. 1, 2, and 3) and the closed-in-place gasoline aqua system UST (Tank No. 4). These borings are denoted as GP-15, GP-16, GP-18, GP-19, and GP-20 on Figure 3. Laboratory analytical results for soil samples GP-15 (10-12' and 13-15'), GP-16 (7-8' and 10-12'), GP-18 (6-7' and 12-14'), GP-19 (9-7' and 15-16'), and GP-20 (7-8') indicated that lead was detected below the Statewide Default Background Level for lead. Ethylbenzene, xylenes, and 1,3,5-trimethylbenzene (from soil sample GP-18/6-7') and toluene and 1,2,4-trimethylbenzene (from soil samples GP-18/6-7' and GP-18/12-14') were also detected below the Tier I Commercial III RBSLs.

Benzene concentrations from soil sample GP-18 (6-7') were detected above the Tier I Commercial Drinking Water RBSL. Soil analytical data and soil sample locations are presented in Table 2a and on Figure 3, respectively.

A groundwater sample was collected from soil boring GP-20 (Figure 3). Groundwater analytical results indicated that naphthalene and 2-methylnaphthalene were detected below the Tier I Commercial III RBSLs. Groundwater analytical data is presented in Table 4.

Gasoline UST Excavation Area

On December 20, 1999, a total of five soil verification samples were collected from the sidewalls of the gasoline UST (Tank No. 12). These soil samples are denoted as 12 N Sidewall (6'), 12 S Sidewall (6'), 12 E Sidewall (6'), 12 W Sidewall (6'), and 12 SE Sidewall (4') on Figure 3. Groundwater was encountered in the excavation pit. Therefore, a groundwater sample (12 bottom) was collected in place of a bottom soil verification sample. Laboratory analytical results for soil samples 12 N Sidewall (6'), 12 S Sidewall (6'), 12 E Sidewall (6'), and 12 SE Sidewall (4') indicated that lead was detected below the Statewide Default Background Level for lead. However, lead was detected above the Statewide Default Background Level for soil sample 12 W Sidewall (6').

Various volatile organic compounds (VOCs) from soil samples 12 N Sidewall (6'), 12 S Sidewall (6'), 12 E Sidewall (6'), 12 W Sidewall (6'), and 12 SE Sidewall (4') were detected below the Tier I Commercial III RBSLs. The following VOC concentrations were detected above the Tier I Commercial III Drinking Water RBSL: benzene and 1,2,4-trimethylbenzene (from soil samples 12 N Sidewall/6', 12 S Sidewall/6', 12 E Sidewall/6', 12 W Sidewall/6', and 12 SE Sidewall/4'), toluene (from soil samples 12 N Sidewall/6', 12 E Sidewall/6', 12 W Sidewall/6', and 12 SE Sidewall/4'), xylenes and 1,3,5-trimethylbenzene (12 N Sidewall/6', 12 W Sidewall/6', and 12 SE Sidewall/4'), and naphthalene and 2-methylnaphthalene (from soil samples 12 N Sidewall/6' and 12 W Sidewall/6'). Soil analytical results and soil sample locations are presented in Table 2a and on Figure 3, respectively.

Groundwater analytical results for groundwater sample Tank 12 Bottom indicated that 1,1-dichloroethane, 1,2-dibromoethane, and lead were not detected at or above the MDEQ method detection limits. Methyl tert-butyl ether (MTBE) concentrations from Tank 12 Bottom was detected below the Tier I Commercial III RBSLs. However, benzene, toluene, ethylbenzene, and xylenes (BTEX), trimethylbenzenes (TMBs), naphthalene, and 2-methylnaphthalene concentrations were detected above the Tier I Commercial III Drinking Water RBSL. Groundwater analytical results are presented in Table 4. The location of Tank No. 12 is presented on Figure 3.

Aqua Trap USTs Excavation Area

On December 29 and 30, 1999, sixteen soil verification samples were collected in the vicinity of the former aqua trap system (Tanks No. 13, 14, 16, 17, and 18). These soil samples are denoted as 13 S Bottom (8'), 13 N Bottom (8'), 13 S Sidewall (3-4'), 13 W Sidewall (3-4'), 14 S Bottom (8'), 14 N Bottom (8'), 16 S Bottom (8'), 16 N Bottom (8'), 16 S Sidewall (4-6'), 16 N Sidewall (2-3'), 17 S Bottom (8'), 17 N Bottom (8'), 18 E Bottom (8'), and 18 W Bottom (8') on Figure 3. Laboratory analytical results for each of the sixteen soil samples indicated that lead was detected below the Statewide Default Background Level for lead.

Various polynuclear aromatics hydrocarbons (PNAs) were detected below the Tier I Commercial III RBSLs from soil samples 13 S Sidewall (3-4'), 13 W Sidewall (3-4'), 16 S Sidewall (4-6'), 16 N Sidewall (2-3'), 17 S Bottom (8'), 17 N Bottom (8'), 18 S Sidewall (6-8'), and 18 N Sidewall (18"). However, laboratory results indicated that from soil sample 13 W Sidewall (3-4') naphthalene was detected above the Tier I Commercial III Drinking Water RBSL.

Various VOCs were detected below the Tier I Commercial III RBSLs from soil samples 13 S Sidewall (3-4'), 13 W Sidewall (3-4'), 14 S Bottom (8'), 14 N Bottom (8'), 16 S Bottom (8'), 16 N Bottom (8'), 16 S Sidewall (4-6'), 16 N Sidewall (2-3'), 17 S Bottom (8'), 17 N Bottom (8'), 18 E Bottom (8'), and 18 W Bottom (8'). The following VOCs were detected above the Tier I Commercial III Drinking Water RBSL: benzene (from soil samples 13 S Sidewall/3-4', 13 W Sidewall/3-4', 16 S Sidewall/4-6', and 18 S Sidewall/6-8'), ethylbenzene and TMBs (from soil samples 13 S Sidewall/3-4', 13 W Sidewall/3-4', 16 S Sidewall/4-6', 16 N Sidewall/2-3', and 18 S Sidewall/6-8'), xylenes

(from soil samples 13 S Sidewall/3-4' and 16 N Sidewall/2-3'), naphthalene (from soil sample 13 S Sidewall/3-4'), and 2-methylnaphthalene (from soil samples 13 S Sidewall/2-3' and 16 S Sidewall/4-6'). Soil analytical data and soil sample locations are presented in Table 2a and on Figure 3, respectively.

Closed-In-Place Waste Oil UST

On December 30, 1999, four soil verification samples were collected in the vicinity of the closed-in-place waste oil UST (Tank No. 11). These soil samples are denoted as 11 S Bottom (11-12'), 11 N Bottom (10-11'), 11 S Sidewall (7-8')/GP-9, and 11 S Bottom (11-12')/GP-9 on Figure 4. Based on visual and PID readings, two of the four soil samples (11 S Bottom/11-12') and 11 N Bottom/10-11') were submitted for laboratory analysis. Laboratory analytical results for each of the two soil samples indicated that VOCs, PNAs, and polychlorinated biphenyls (PCBs) were not detected at or above the MDEQ method detection limits. Cadmium, chromium, and lead were detected below the Tier I Commercial III RBSLs for each of the two soil samples. Soil analytical data and soil sample locations are presented in Table 2a and on Figure 4, respectively.

Closed-In-Place Engine Oil, Converter Oil, and Dextron USTs

On December 30, 1999, and January 5, 2000, nine soil verification samples were collected using a Geoprobe® in the vicinity of the closed-in-place engine oil USTs, converter oil UST, and dextron UST (Tank No. 5, 6, 7, and 8). These soil samples are denoted as 5 N Sidewall (4-6'), 5 Bottom (10-11'), 6 N Sidewall (4-6'), 6 Bottom (9-11'), 7 N Sidewall (2-3'), 7 N Sidewall (6-7'), 7 Bottom (10-11'), 8 N End (2-3'), and 8 N End (10-11') on Figure 3. Laboratory results for soil samples 5 N Sidewall (4-6'), 7 N Sidewall (6-7'), 7 Bottom (10-11') indicated that TMBs were detected below the Tier I Commercial III RBSLs. However, TMBs for soil samples 6 N Sidewall (4-6'), 6 Bottom (9-11'), 7 N Sidewall (2-3'), and 8 N End (2-3') were detected above the Tier I Commercial III Drinking Water RBSL.

Various PNAs for soil samples 5 N Sidewall (4-6'), 6 N Sidewall (4-6'), 6 Bottom (9-11'), 7 N Sidewall (2-3'), 7 N Sidewall (6-7'), 7 Bottom (10-11'), 8 N End (2-3'), and 8 N End (10-11') were detected below the Tier I Commercial III RBSLs. Naphthalene and 2-methylnaphthalene were detected above the Tier I Commercial III Drinking Water RBSL for soil samples 7 N Sidewall (2-3') and 8 N End (2-3'). Soil analytical and soil sample locations are presented in Table 2b and on Figure 3, respectively.

Engine Oil and Gasoline Reserve UST Excavation Area

On December 20 and 23, 1999, seventeen soil verification samples were collected in the vicinity of the two engine oil reserve USTs (Tank No. 9 and 10), the gasoline reserve UST (Tank No. 19), and the associated UST piping. These soil samples are denoted as 9 E Bottom (14'), 9 W Bottom (14'), 9 E Sidewall (8'), 9 W Sidewall (18'), 9 SE Sidewall (10'), 9 SW Sidewall (4'), 10 E Bottom (14'), 10 W Bottom (14'), 10 E Sidewall (6'), 10 W Sidewall (8'), Pipe Run (3'), 19 E Bottom (14'), 19 W Bottom (14'), 19 E Sidewall (8'), 19 W Sidewall (8'), 19 NE Sidewall (8.5'), and 19 NW Sidewall (9') on Figure 5. Laboratory results for soil samples E Bottom (14'), 9 W Bottom (14'), 9 E Sidewall (8'), 9 W Sidewall (18'), 9 SE Sidewall (10'), 9 SW Sidewall (4'), 10 E Bottom (14'), 10 W

Sidewall (8'), 19 E Bottom (14'), 19 W Bottom (14'), 19 E Sidewall (8'), 19 W Sidewall (8'), 19 NE Sidewall (8.5'), and 19 NW Sidewall (9') were detected below the Statewide Default Background Level for lead. For soil samples 10 W Bottom (14'), 10 E Sidewall (6'), and Pipe Run (3'), lead was detected above the Tier I Commercial III Drinking Water RBSL.

Various PNAs were detected below the Tier I Commercial III RBSLs for soil samples 9 E Sidewall (8'), 9 W Sidewall (10'), 10 W Bottom (14'), 10 E Sidewall (6'), Pipe Run (3'), 19 E Sidewall (8'), and 19 NE Sidewall (8.5'). In addition, various VOCs were detected below the Tier I Commercial III RBSLs for soil samples E Bottom (14'), 9 W Bottom (14'), 9 E Sidewall (8'), 9 W Sidewall (18"), 9 SE Sidewall (10'), 9 SW Sidewall (4'), 10 W Bottom (14'), 10 E Sidewall (6'), 10 W Sidewall (8'), Pipe Run (3'), 19 E Sidewall (8'), and 19 NW Sidewall (9'). However, the following VOCs were detected above the Tier I Commercial III Drinking Water RBSL: benzene (from soil samples 9 E Sidewall/8', 9 W Sidewall/10', 10 W Bottom/14', 10 E Sidewall/6', 10 W Sidewall/8', and 19 E sidewall/8'), toluene (from soil samples 10 W Bottom/14' and 19 E Sidewall/8'), ethylbenzene (from soil samples 9 E Bottom/14', 9 W Bottom/14', 10 W Bottom/14', and 19 E Sidewall/8'), xylenes (from soil samples 10 W Bottom/14' and 19 E Sidewall/8'), and TMBs (from soil samples 9 W Bottom/14', 9 W Sidewall/18", 10 W Bottom/14', 10 E Sidewall/6', and 19 E Sidewall/8'). Soil analytical results and soil sample locations are presented in Table 2a and on Figure 3, respectively.

C. Describe any soil remediation or disposal activities performed to date, including the volume of soil remediated or disposed. Indicate the disposal location, and provide proof of disposal (e.g., invoices, not load tickets).

Approximately 1,020 cubic yards of impacted soil were excavated and disposed at Browning-Ferris Industries (BFI) located at Arbor Hills Landfill 10930 Six Mile Road in Northville, Michigan. Manifests are included in Attachment B.

D. Provide a site diagram which identifies the estimated horizontal and vertical extent of on-site and off-site soil contamination. Include the maximum concentrations and sample depths.

Maximum soil concentrations are presented on Figures 3, 4, and 5. Figure 3 depicts sample locations in the vicinity of the closed-in-place diesel aqua system USTs (Tank No. 1, 2, and 3), the closed-in-place gasoline aqua system UST (Tank No. 4), closed-in-place engine oil USTs (Tank No. 5 and 6), the closed-in-place converter oil UST (Tank No. 7), and the closed-in-place dextron UST (Tank No. 8), and the gasoline UST (Tank No. 12). Figure 4 depicts sample locations in the vicinity of the closed-in-place waste oil UST (Tank No. 11). Figure 5 depicts sample location in the vicinity of the engine oil reserve USTs (Tank No. 9 and 10) and the gasoline reserve UST (Tank No. 19).

E. Provide an estimate of the volume of impacted soil remaining in the vadose zone.

An estimate of the volume of impacted soil remaining in the vadose zone will be determined upon completion of the proposed site investigation, as summarized in Section 5.3 C.

F. Describe steps that have been taken, or will be taken, to secure access to off-site properties, including easements and right-of-ways, to complete the delineation of the extent of the off-site impact of the release to soil. Include the names and addresses of potentially affected off-site property owners.

At this time, off-site access has not been solicited. In order to delineate the extent of the plume north of the subject property (commercial property), off-site access will be pursued.

G. Provide the schedule for completing the delineation of the extent of the off-site impact of the release to the soil.

Based on the results of the UST closure activities, the extent of the off-site impact of the release to the soil will be investigated. The scope of work and schedule for the proposed off-site plume delineation investigation are summarized in Section 5.3 C.

H. Provide a table with field screening and laboratory data showing the results of all soil sampling performed to date for the required parameters. Refer to the STD Operational Memorandum No. 14 (Analytical Parameters and Methods, Sample Handling, and Preservation for Petroleum Releases).

Field screening results for soil are presented in Table 1. Soil analytical data is presented in Tables 2a and 2b. The following analytical parameters were used:

Leaded Gasoline Parameters

Soil samples collected in the vicinity of the gasoline UST (Tank No. 12), the gasoline aqua system UST (Tank No. 4), and the gasoline reserve UST (Tank No. 19) were submitted for laboratory analysis of benzene, toluene, ethylbenzene, and xylenes (BTEX), methyl tert-butyl ether (MTBE), 1,2,4-trimethylbenzene and 1,3,5-trimethylbenzene (TMBs), 1,2-dibromoethane, 1,2-dichloroethane, naphthalene, and 2-methylnaphthalene by U.S. EPA Method 8260 and lead by U.S. EPA Method 6010 (Table 2a).

Residual Oil Parameters

Soil samples collected in the vicinity of the closed-in-place engine oil USTs (Tank No. 5 and 6), the closed-in-place converter oil UST (Tank No. 7), the closed-in-place dextron UST (Tank No. 8) and the engine oil reserve USTs (Tank No. 9 and 10) were submitted for laboratory analysis of TMBs by U.S. EPA Method 8260 and PNAs by U.S. EPA Method 8310 (Table 2a).

Light Distillate Oil Parameters

Soil samples collected in the vicinity of the closed-in-place diesel aqua system USTs (Tank No. 1, 2, and 3) were submitted for laboratory analysis of BTEX and TMBs by U.S. EPA 8260 and PNAs by U.S. EPA Method 8310 (Table 2a).

Waste Oil Parameters

Soil samples collected in the vicinity of the closed-in-place waste oil UST (Tank No. 11) excavation were submitted for laboratory analysis of volatile halocarbons (includes BTEX, TMBs, 1,2-dibromoethane, 1,2-dichloroethane) by U.S. EPA Method 8260, PNAs by U.S. EPA Method 8310, PCBs by U.S. EPA Method 8082 and cadmium, chromium, and lead by U.S. EPA Method 6010 (Tables 2b and 2c).

I. Provide a table which compares the maximum remaining soil contaminant concentrations for each required parameter to the appropriate RBSLs as provided in STD Operational Memorandum No. 4 (Tier I Lookup Tables for Risk-Based Corrective Action at Leaking Underground Storage Tank Sites). If residential leaching to groundwater RBSLs are not utilized for comparison, provide an explanation.

A soil comparison table is presented in Table 3. Commercial III leaching to groundwater RBSLs were utilized based on the land use and zoning of the site.

J. Provide soil boring logs.

Soil boring logs generated during Geoprobe® drilling activities are included in Attachment A.

K. Identify any known soil contamination not related to the release and the source, if known.

Not Applicable.

3.4 GROUNDWATER CONDITIONS AND CHARACTERISTICS

A. Describe the site hydrogeology, and include: depth to groundwater and method of determination; whether the groundwater is potable and/or not in an aquifer, provide the basis for this determination (Refer to STD Operational Memorandum No. 11, Criteria to Eliminate the Potable Groundwater Pathway); whether the groundwater is currently used as a source of drinking water, either residential or municipal; whether groundwater is being used for a purpose other than drinking water; whether more than one groundwater unit is present beneath the site; depth to bottom of water-bearing layer; predominant soil type in water-bearing stratum (e.g., sand, silt); effective porosity of water-bearing stratum (in $\text{cm}^3 \text{ void}/\text{cm}^3 \text{ matrix}$), and describe how it was determined; hydraulic conductivity, and describe how it was determined; groundwater flow rate and direction; lateral component of the hydraulic gradient; hydrogeologic conditions that could influence flow direction; and magnitude and direction of the vertical component of the hydraulic gradient.

At this time, an insufficient amount of groundwater characterization data is available to appropriately compare site data to the MDEQ storage tank division (STD) Operational Memorandum No. 11 (dated August 25, 1997) to determine whether the potable water pathway can be eliminated. Therefore, in this report, site data were compared to the MDEQ Drinking Water RBSLs. As summarized in Section 5.3 C of this report, the proposed site investigation will provide the additional data necessary to characterize the groundwater and evaluate the potable groundwater pathway. The proposed site investigation will include determining the effective porosity of the water-bearing stratum, the hydraulic conductivity, the groundwater flow rate and direction, the lateral component of the hydraulic gradient, and the magnitude and direction of the vertical component of the hydraulic gradient.

Based on the results of the water well log search conducted through the MDEQ water well log division in Lansing, there is no evidence that groundwater is being used as a source of drinking water at the site or in the vicinity of the site. It is unknown whether more than one groundwater unit is present beneath the site and the depth to the bottom of the water-bearing layer is unknown. The predominant soil type encountered in the shallow perched groundwater zone was sand (fill material).

B. Attach copies of the following: boring logs, well construction diagrams, potentiometric surface map, and elevation data (USGS datum preferred), including top-of-casing, and grade elevations, and depth to groundwater.

Soil boring logs are included in Attachment A. Upon completion of the proposed site investigation (summarized in Section 5.3 C), a potentiometric surface map and an elevation data table will be submitted to the MDEQ.

C. Provide scaled maps and cross-sectional diagrams, showing the screened and/or sampling interval, which depict the extent of impact and the maximum concentrations.

Maximum groundwater concentrations, sample intervals, and cross-sectional diagrams will be prepared and submitted to the MDEQ upon completion of the proposed site investigation activities (Section 5.3 C).

D. Indicate whether more than one groundwater unit has been impacted.

More than one groundwater unit has not been encountered at the site.

E. Describe any groundwater remediation activities performed to date, including the total volume of groundwater remediated and the disposition of this groundwater.

No groundwater remediation activities were performed to date at the site.

F. Provide an indication of whether the plume currently extends off-site.

At this time, it is unknown whether the plume extends off-site. Delineation of the extent of plume will be investigated as proposed in Section 5.3 C. Results of the investigation will be presented to the MDEQ.

G. Describe steps that have been taken, or will be taken, to secure access to off-site properties, including easements and right-of-ways, for the purpose of completing the delineation of the extent of the release to groundwater, and provide the names and addresses of off-site property owners.

Verification of whether the plume extends off-site, along the northern property boundary, will be determined upon completion of the proposed site investigation activities summarized in Section 5.3 C. If the results of the site investigation indicate the plume extends off-site, then action will be taken to secure off-site access.

H. Provide the schedule for completing the delineation of the extent of the off-site impact of the release to groundwater.

Upon completion of the proposed site investigation (Section 5.3 C) and review of the results, off-site access will be pursued. Off-site delineation will begin as soon as off-site access is granted. Delineation of the plume is scheduled to be completed prior to the submittal of the Final Assessment Report for this site.

I. Provide a table with field screening and laboratory data showing the results of all groundwater sampling performed to date for the required parameters. Refer to the STD Operational Memorandum No. 14.

A field screening table for groundwater is not available. Laboratory analytical results for groundwater are presented in Table 4. A comparison table for maximum concentrations in groundwater to the Tier I Commercial III RBSLs is presented in Table 5.

3.5 CONDITIONS AND CHARACTERISTICS IN OTHER ENVIRONMENTAL MEDIA

A. Describe the evaluations conducted to determine if other environmental media have been impacted.

Not Applicable. It is not deemed necessary, at this time, for other environmental media to be investigated.

4.0 SITE CLASSIFICATION

A. Indicate the current Site Classification Level, in accordance with STD Operational Memorandum No. 5, Leaking Underground Storage Tank (LUST) Site Classification System.

In accordance with the STD Operational Memorandum No. 5, LUST Site Classification System, the current site classification level is Class 3.

B. Provide a justification for this classification. Identify the current conditions that are the basis of the classification, and dates that the prescribed initial response actions were implemented.

This classification is appropriate based on soil concentrations detected above the MDEQ Tier I Commercial III Drinking Water RBSLs. Response actions were implemented on December 20, 1999.

5.0 RESULTS OF THE RBCA EVALUATION

5.1 EXPOSURE PATHWAY CHARACTERIZATION

A. Identify and describe the potentially applicable Exposure Scenarios:

<i>Exposure Scenarios</i>	<i>Exposure Pathway Characterization</i>
<i>Potential Source(s)</i>	- Impacted Soils - Dissolved Groundwater Plume
<i>Potential Transport Mechanism(s)</i>	- Volatilization and Atmospheric Dispersion - Volatilization and Enclosed-Space Accumulation - Utility Corridors - Leaching and Groundwater Transport
<i>Potential Exposure Route(s)</i>	- Soil Ingestion - Direct Contact of Soil with Skin - Inhalation of Volatiles - Direct Contact with Groundwater
<i>Potential Receptor(s)</i>	- Construction Worker - Commercial Worker - Structures - Utilities

Exposure pathways for groundwater will be evaluated during the proposed site investigation activities (see Section 5.3 C). Upon completion of the investigation, results will be presented to the MDEQ.

B. List each possible exposure pathways for each land use, and sensitive habitat for the site. Provide an explanation for eliminating any pathways.

Residential Exposure Pathways: The subject property land use and zoning is commercial. No residential construction exists on, near, or will be approved for, this location. No residential receptors are known to exist; therefore, this pathway is incomplete.

Commercial Exposure Pathways: The most plausible potential commercial exposure pathway for the site is direct contact with soil or groundwater during construction activities such as excavation, utility repair, etc.

Industrial Exposure Pathways: No industrial receptors are known to exist; therefore, the pathway is incomplete.

Sensitive Habitat Exposure Pathways: No sensitive habitat receptors are known to exist; therefore, the pathway is incomplete.

5.2 OPTIONAL TIER II EVALUATION

A. Indicate whether a site-specific Tier II or evaluation has been conducted for this site.

At this time, a site-specific Tier II evaluation is not necessary. Therefore, it has not been conducted for this site.

B. If applicable, identify and justify where alternate assumptions or site-specific information were used in place of the default assumptions as defined in the USTD Operational Memorandum No. 4.

Not applicable.

C. Provide the calculations and reference citations supporting the development of the relevant Tier II SSTLs.

Not applicable.

D. Provide a table which compares the maximum remaining contaminant concentrations for each required parameter for all media to the appropriate RBSLs (as provided in the STD Operational Memorandum No. 4), and the calculated SSTLs. Identify all applicable land use scenarios, and indicate whether or not there is an exceedance of the RBSLs or the SSTLs.

Not applicable.

5.3 PROPOSED FOLLOW-UP ACTIVITIES

A. Based on the results of the Tier I or Tier II evaluation, indicate the follow-up activities proposed for the site (e.g., site closure interim corrective action with subsequent reevaluation; final corrective action to achieve Tier I RBSLs or Tier II SSTLs; or perform further site-specific Tier II or Tier III evaluation to establish alternative SSTLs that meet the target risk goals).

The proposed interim corrective actions will initially begin with an on-site investigation to delineate soil and groundwater impact and determine the groundwater characteristics and conditions at the site. In addition, the on-site investigation will provide data to determine whether the plume extends off-site. If results indicate that the plume extends off-site, off-site access will be pursued. Upon approval of off-site access, an investigation will be conducted off-site to delineate the extent of the plume and evaluate off-site conditions. Results of the proposed investigation will be presented in the Final Assessment Report (FAR).

B. Provide justification for the option chosen.

Based on the results of the soil verification samples collected during UST closure activities, the extent of soil and groundwater impact and the groundwater conditions at the site have not been completely defined in order to evaluate the appropriate remedial action or closure options for the site. Therefore, site conditions will be further evaluated from data collected during the proposed site investigation activities (see Section 5.3 C). As indicated in Section 5.3 A, the results of the proposed site investigation will be presented in the FAR.

C. Provide a Work Plan and implementation schedule that describes the proposed site characterization activities to be performed to determine the horizontal and vertical extent of contamination. Include a scaled site map depicting proposed sampling locations.

Purpose

The purpose of this proposed site investigation is to present sufficient data to define the extent of soil and groundwater impact identified during the UST closure activities. In addition, this proposed site investigation will provide data to determine the characteristics and conditions of the soil and groundwater and to evaluate the potential exposure pathways. The proposed site investigation activities are summarized in detail below.

Drilling and Sampling Activities

Prior to conducting drilling activities, underground utilities will be located and documented. In addition, the City of Detroit Water & Sewage Department will be contacted for any available maps depicting the location and depth of buried utility corridors.

To adequately define the extent of soil and groundwater impact at the site, a total of seventeen soil borings are proposed to be advanced. Proposed boring locations are presented on Figures 6A and 6B. The location and number of borings selected was established based on the analytical results from samples collected during the UST closure activities. The final locations of these borings may be altered due to conditions encountered in the field during drilling activities.

Proposed soil borings will be advanced using a Geoprobe® truck-mounted drill rig. Geoprobe® drilling will be performed using two-inch stainless steel probes that will be hydraulically driven. Soil samples will be collected continuously using a macro core sampling device, which provides a four-foot long sample encapsulated in a clear acetate sleeve. Soil borings will be advanced to a maximum depth of 20 feet bg. However, if significant contamination is present at this depth, the borings will be advanced beyond 20 feet bg to determine the approximate vertical extent of contamination.

Upon retrieval to the surface, soil samples will be visually inspected, classified geologically, and field screened with an organic vapor meter (OVM) equipped with a photoionization detector (PID). The soil samples exhibiting the maximum visual, olfactory, or PID evidence of contamination from each boring will be selected for laboratory analysis. If all soil samples from a soil boring exhibit minimal visual, olfactory, or PID evidence of contamination, then the soil sample collected approximately two to four feet above the water table will be selected for analysis. In addition, the boring terminus sample will be collected to define the approximate vertical extent of contamination.

Soil samples collected for laboratory analysis will be preserved with methanol, labeled, and stored on ice in a cooler. Proper chain-of-custody procedures will be followed. Soil samples will be submitted to the laboratory for the following analyzes and parameters:

- In the vicinity of the closed-in-place waste oil UST (Tank No. 5), soil samples will be submitted for laboratory analysis of BTEX, TMBs, 1,2-dichloroethane, 1,2-dibromoethane, and volatile halocarbons by U.S. EPA Method 8260, PNAs by U.S. EPA Method 8310, cadmium, chromium, and lead by U.S. EPA Method 6010, and PCBs by U.S. EPA Method 8082. These parameters are required by the MDEQ for the previous storage of waste oil at a site.
- In the vicinity of the former gasoline UST (Tank No. 12), the former gasoline reserve UST (Tank No. 19), the closed-in-place gasoline aqua system UST (Tank No. 4), the closed-in-place diesel aqua system USTs (Tank No. 1, 2, and 3), and the former aqua system trap USTs (Tank No. 13, 14, 16, 17, and 18), soil samples will be submitted for laboratory analysis of BTEX, MTBE, TMBs, 1,2-dichloroethane, 1,2-dibromoethane, naphthalene, and 2-methylnaphthalene by U.S. EPA Method 8260, and PNAs by U.S. EPA Method 8310. These parameters are required by the MDEQ for the previous storage of gasoline and diesel.

- In the vicinity of the closed-in-place engine oil USTs (Tank No. 5 and 6), the closed-in-place converter oil UST (Tank No. 7), and the closed-in-place dextron UST (Tank No. 8), soil samples will be submitted for laboratory analysis of TMBs by U.S. EPA Method 8260 and PNAs by U.S. EPA Method 8310. These parameters are required by the MDEQ for the previous storage of residual oils at a site.

Field Standard Operating Procedures (SOPs) for Geoprobe® and HSA drilling, Quality Assurance/Quality Control (QA/QC) sampling, decontamination procedures, and health and safety plans are included in Attachment C.

Monitoring Well Installation

Based on the soil and groundwater conditions encountered during Geoprobe® drilling, approximately eight of the seventeen proposed soil borings will be completed as permanent monitoring wells (Figures 6A and 6B) to monitor groundwater concentrations at the site. In borings not completed as permanent monitor wells, a groundwater sample will be collected from the boring prior to abandonment. The monitor wells will be installed using a hollow stem auger (HSA) drill-rig. Drilling will be performed using a ¼ -inch inner diameter (ID) HSA.

Monitor wells will be constructed of two-inch ID polyvinyl chloride (PVC) materials, with a screen length of five feet. Screens will be of the machine slotted type, and the slot size will be 0.010 inches. Wells will be installed such that the screened interval is straddling the water table. The approximate depth will be determined in the field during drilling. The wells will be sealed with expandable locking caps and finished with flush mounted protective covers set in concrete.

The annular space around the wells will be packed with silica filter sand from the bottom of the screen to approximately one foot above the screen, followed by a one-foot thick bentonite seal. The remaining annular space will be filled with either bentonite chips or cement grout to the concrete pad. Locking water tight well caps will be placed on each well and flush-mounted, traffic-rated, steel protective covers will be set in concrete and installed to prevent unauthorized access and for the protection of the monitoring well.

After the wells are installed, each well will be developed by a combination of appropriate techniques, including bailing, surging, jetting, or pumping to ensure maximum communication with the aquifer across the screened interval. Each well (top of casing) will be surveyed to the nearest 0.01 foot to allow for groundwater flow direction calculations.

SOPs for monitoring well installation, well development, and well purging are included in Attachment C.

Groundwater Sampling

Groundwater samples will be collected from the newly installed monitor wells a minimum of 24 hours after development. Upon opening the each monitor well cap, the depth to water will be measured from the top of each well casing and recorded to the nearest 0.01 foot. This will provide data for calculating the volume of water to purge and for calculating the groundwater flow direction and gradient.

Prior to collecting groundwater samples from each of the newly installed monitor wells, three wetted-casing volumes of groundwater will be purged from the well. The purging will remove stagnant water from the well casing, ensuring that the sample is representative of the groundwater at the screened interval of the well. After purging, a groundwater sample will be collected using a new disposable polyethylene bailer with new bailer cord. Groundwater samples will be placed in appropriately preserved sample containers provided by the laboratory. Samples collected for dissolved lead analysis will be field-filtered through a 0.45-micron filter prior to collection. Once groundwater samples have been collected, samples will be stored on ice in a cooler and submitted to the laboratory. Proper chain-of-custody procedures will be followed. Groundwater samples will be submitted for the same analytical parameters as the soil samples, described above.

SOPs for groundwater sampling and QA/QC control sampling are included in Attachment C.

Hydrogeologic Characteristics Determination

The newly installed monitor wells will be surveyed to provide data for calculating the groundwater elevation for determining the groundwater flow direction. Survey measurements will be obtained from the north side of the top of each well casing. An assigned elevation of 100 feet will be used as a temporary benchmark. The survey data will be combined with the static water level measurements obtained during the groundwater sampling activities. A table presenting the groundwater elevation and a groundwater contour map will be presented to the MDEQ in a Quarterly Groundwater Monitoring Report.

Hydraulic conductivity testing will be performed on select monitor wells to characterize the hydraulic properties of the site's water-bearing zone. The hydraulic conductivity will be calculated with an equation based on the research of Bouwer and Rice, 1976 (Bouwer and Rice). Other hydrogeologic parameters, such as groundwater velocity and hydraulic gradient, will also be determined.

Off-Site Plume Delineation Investigation

If results from the proposed on-site investigation indicate that the plume extends off-site onto the Grand Trunk Railroad property (located southeast of the site), then off-site access will be pursued. Upon approval of off-site access, the extent of the plume will be investigated. The number of soil borings/monitoring wells to be installed off-site will be based on the results of the on-site investigation.

Report Preparation

Groundwater sampling from the newly installed monitor wells will be conducted on a quarterly basis. Results of the groundwater sampling activities will be presented to the MDEQ in a Quarterly Groundwater Monitoring Report. This report will also include groundwater elevation data and a groundwater contour map.

Results of the proposed site investigation activities will be included in a Final Assessment Report (FAR). This report will be submitted to the MDEQ and include a detailed description of the work completed at the site, an interpretation of the data, an evaluation of potential exposure pathways, and a feasibility analysis. If the investigation and quarterly groundwater monitoring results indicate that the site can be closed without further remediation and/or monitoring, a Closure Report will be submitted in lieu of the FAR.

Schedule

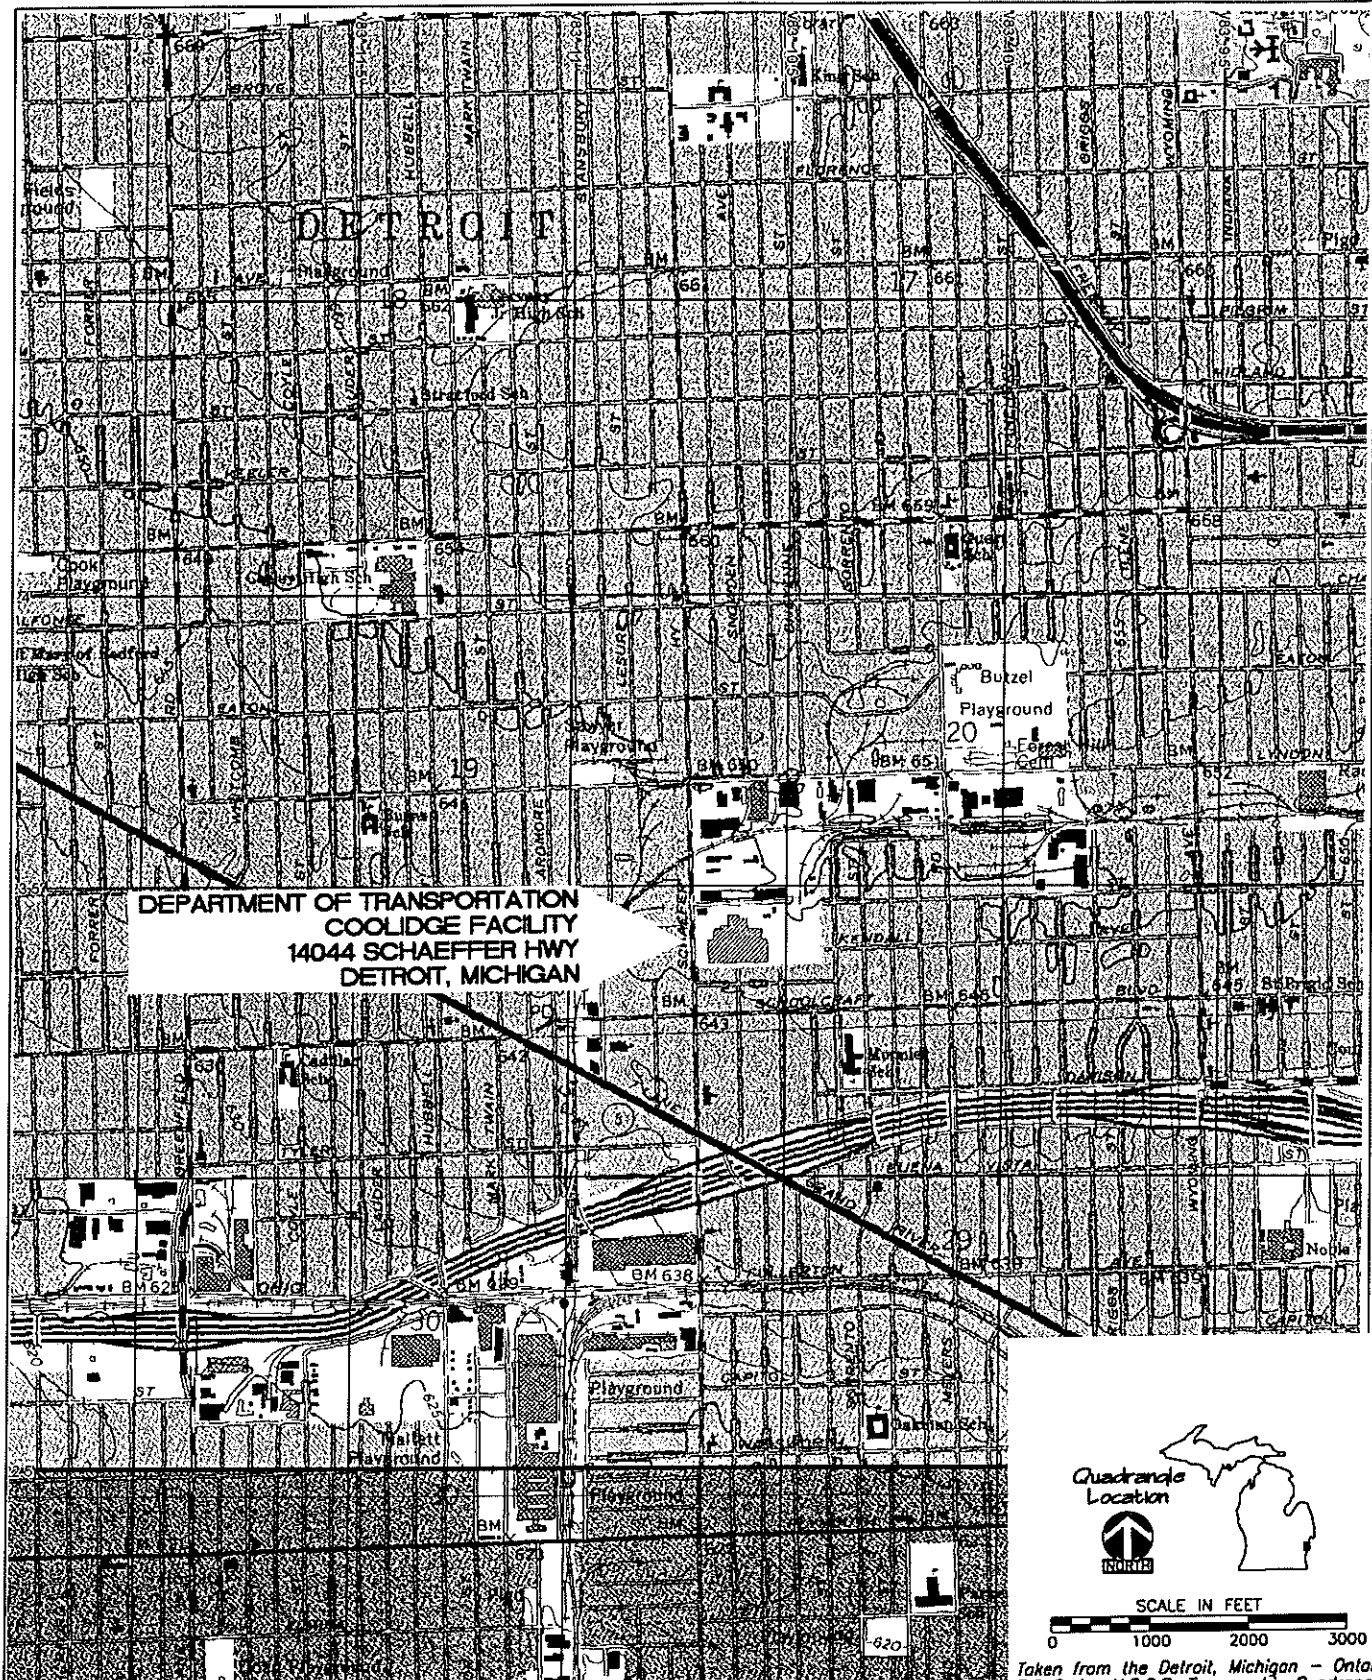

The proposed on-site investigation activities are tentatively scheduled to begin in May 2000. Based on the results of the on-site investigation, verification of whether the plume extends off-site will be determined. If results indicate that the plume extends off-site, then off-site plume delineation will be conducted. Groundwater concentrations will be monitored on a quarterly basis after initial installation and sampling. Prior to initiating field activities, the MDEQ will be notified a minimum of 48-hours.

Since the FAR is required to be submitted to the MDEQ-STD within 365 days after a release has been discovered, a FAR for this site will be prepared and submitted to the MDEQ-STD in December 2000.

B=background, as defined in Rule 299.5701(c), may be substituted if higher than cleanup criterion. D=Calculated criterion exceeds 100%; hence, it is reduced to 100% (i.e., 1.0E+9 ppb). G=GSI value is pH or water hardness dependent. M=calculated criterion is below the analytical method detection limit (MDL); therefore, the criterion defaults to the MDL. X=The GSI criterion shown is not protective for surface water that is used as a drinking water source. ID=inadequate data to develop criterion. IP=Development of criteria in process. NA=Criterion or value is not available or, as is the case for Csat, not applicable. NLL=Chemical is not likely to leach under most soil conditions. NLV=Chemical is not likely to volatilize under most conditions. NR = Analysis not requested.

B=background, as defined in Rule 289.5701(c), may be substituted if higher than cleanup criterion. D=Calculated criterion exceeds 100%; hence, it is reduced to 100% (i.e., 1.0E+9 ppb). G=GSI value is pH or water hardness dependent. M=calculated criterion is below the analytical method detection limit (MDL); therefore, the criterion defaults to the MDL. X=The GSI criterion shown is not protective for surface water that is used as a drinking water source. ID=Inadequate date to develop criterion. IP=Development of criteria in process. NA=Criterion or value is not available or, as is the case for Csat, not applicable. NLL=Chemical is not likely to leach under most soil conditions. NLV=Chemical is not likely to volatilize under most conditions. NR = Analysis not requested.

B=background, as defined in Rule 299.5701(c), may be substituted if higher than cleanup criterion. D=Calculated criterion exceeds 100%; hence, it is reduced to 100% (i.e., 1.0E+9 ppb). G=GSI value is pH or water hardness dependent. M=calculated criterion is below the analytical method detection limit (MDL); therefore, the criterion defaults to the MDL. X=The GSI criterion shown is not protective for surface water that is used as a drinking water source. ID=Inadequate data to develop criterion. IP=Development of criteria in process. NA=Criterion or value is not available or, as is the case for Csat, not applicable. NLL=Chemical is not likely to leach under most soil conditions. NLV=Chemical is not likely to volatilize under most conditions. T=Refer to the Toxic Substances Control Act (TSCA), 40 CFR 761, Subparts D and G, as amended to determine the applicability of TSCA cleanup standards.

Notes:

1. ND = Not detected at or above the MDEQ method detection limits.
2. NA = Not applicable
3. ** = Criterion not published to date by the MDEQ.
4. Exposure Codes:
 - A = Industrial and Commercial Drinking Water Protection RBSL
 - B = Commercial III Direct Contact
 - C = Soil Volatilization to Indoor Air Inhalation RBSL
 - D = Infinite Source Volatile Soil Inhalation RBSL (VSIC)
 - E = Statewide Default Background Level
5. Shaded values represent exceedance of the most stringent applicable cleanup criteria.

2-Methylnaphthalene	750 ID		32,000	750	1,400	ND	5.0

B=background, as defined in Rule 299.5701(c), may be substituted if higher than cleanup criterion. D=Calculated criterion exceeds 100%; hence, it is reduced to 100% (i.e., 1.0E+9 ppb). G=GSI value is pH or water hardness dependent. M=calculated criterion is below the analytical method detection limit (MDL); therefore, the criterion defaults to the MDL. X=The GSI criterion shown is not protective for surface water that is used as a drinking water source. ID=Inadequate data to develop criterion. IP=Development of criteria in process. NA=Criterion or value is not available or, as is the case for Csat, not applicable. NLL=Chemical is not likely to leach under most soil conditions. NLV=Chemical is not likely to volatilize under most conditions. NR = Analysis not requested.

2-Methylnaphthalene	Tank 12 Bottom	12/21/99	1,400	750	A	Yes

Notes:

1. ND = Not detected at or above the MDEQ method detection limits.
2. NA = Not applicable
3. ** = Criterion not published to date by the MDEQ.
4. Exposure Codes:
 - A = Industrial and Commercial Drinking Water Protection RBSL
 - B = Commercial III Direct Contact
 - C = Soil Volatilization to Indoor Air Inhalation RBSL
 - D = Infinite Source Volatile Soil Inhalation RBSL (VSIC)
 - E = Statewide Default Background Level
5. Shaded values represent exceedence of the most stringent applicable cleanup criteria.

CONFIRMED RELEASE NUMBER(S): 1. C-1332-99,
2. C-1333-99, 3. C-1388-99, and 4. C-88-00

O/O NAME: City of Detroit

O/O STREET ADDRESS: 5300 Chrysler Service Drive

STATE: MI

ZIP CODE: 48211

CONTACT PERSON: Ken Ong

PHONE NUMBER: 313.833.3000

ANSWER ALL QUESTIONS

1. Type(s) of product released: Diesel

2. Free product present:

a. Currently? YES NO

If YES, total gallons recovered since last report: 1.53

b. Previously? YES NO

If YES, total gallons recovered to date: 2.72

3. Have vapors been identified in any confined spaces (basement, sewers)? YES NO

4. Estimated depth to groundwater: 4 feet

Estimated groundwater flow direction: radial

5. Estimated distance and direction from point of release to nearest:

a. Private well: > 1/2 Mile

b. Municipal well: > 1/2 Mile

c. Surface water/wetland: Detroit River, > 1Mile South

6. Since last report: a. cubic yards of soil remediated: 1,520

b. gallons of groundwater remediated: 0

7. Totals to date: a. cubic yards of soil remediated: 6,260

b. gallons of groundwater remediated: 2,800

8. Michigan RBCA Site Classification (1-4): 1

9. Has contamination migrated off-site above Tier 1 Residential RBSLs YES NO

If YES, have off-site impacted parties been notified (per Section 21309a(3) of Part 213 YES NO

10. MTBE

Has MTBE been detected in any groundwater sample?

YES NO

Maximum MTBE concentration found in groundwater

39 ppb.

CERTIFICATION OF REPORT COMPLETION

I, the undersigned CP, hereby attest to the best of my knowledge and belief that the statements in this document and all attachments are true, accurate, and complete. I certify that the report was submitted to the Remediation & Redevelopment Division (RRD).

FREE PRODUCT RECOVERY STATUS REPORT

Authorized by Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Act 451).

INSTRUCTIONS: Use the checklist below to ensure that all required information is provided in the Quarterly Free Product Recovery Status Report and submit WITH THE SUPPLEMENTAL REPORT COVER SHEET (EQP3849) to the appropriate Remediation & Redevelopment Division (RRD) district office. See form eqp4410 for a complete list of RRD district offices. Include this checklist as a table of contents. Each page of the report should be consecutively numbered. The location column should be completed with the appropriate page number for each item. Refer to Storage Tank Division Operational Memorandum No. 7 for further instructions. The reporting schedule may be altered at the discretion of the DEQ project manager based on site conditions.	FACILITY ID NUMBER: 00013464
	SITE NAME: Detroit Department of Transportation
	COUNTY: Wayne

Section	Table of Contents	Page
1.0	<u>ACTIVITIES COMPLETED</u> Section 21307(2) and (3)(b),(c)	
	A. Describe response activities completed to address free product.	1
2.0	<u>EXPOSURE PATHWAY EVALUATION</u> Section 21307(2)(a),(e) and (3)(c)	
	A. Identify and describe complete exposure pathways related to the free product.	2
	B. Provide a scaled site map, which shows the extent of free product including the utility corridors, buildings with or without basements, private wells, and sensitive habitat/surface water.	1, Figure 1
3.0	<u>DATA TREND ANALYSIS</u> Section 21307(2)(c)(i),(ii) and (3)(c)	
	A. Provide a data summary table for all wells that contain free product. The table should include monitoring point location, date sampled, depth to water, free product thickness, and quantity of free product removed.	2, Table 1
	B. Provide graphs of static water elevations of a well near the free product plume versus free product apparent thickness compared over time. These graphs should be provided for all monitoring wells that have shown free product.	2, Graph 1
	C. Provide graphs of static water elevations versus groundwater concentration (e.g., Benzene, MTBE, and/or total BTEX) in select downgradient monitoring wells compared over time.	Graph 2
4.0	<u>FEASIBILITY ANALYSIS ON SELECTION OF RECOVERY SYSTEM</u> Section 21307(2)(c)(i),(ii) and (3)(c), and 21308a(1)(b)(xviii)	
	A. Provide initial and any subsequent bail-down test recovery data, analysis of which will determine the frequency of recovery. Refer to the references in Storage Tank Division Operational Memorandum No. 7 for sample calculations.	2
	B. Attach a schematic drawing of the free product recovery system.	2
5.0	<u>PERMITTING AND WASTE DISPOSAL TRACKING</u>	
	A. Provide copies of manifests or trip logs of liquid industrial waste or recycling per Section 21307(2)(c)(iii) and (3)(c), and 21308a(1)(b)(xvii)(H).	2
	B. Provide the air quality sampling results and calculations to meet Rule 290 of the Air Pollution Control Rules promulgated under Part 55, Air Pollution Control, of Act 451.	2
6.0	<u>OPERATION AND MAINTENANCE RECOVERY DATA</u> Section 21307(2)(c)(i),(ii) and (3)(c)	
	A. Describe any free product system design modifications, since last submittal.	2
	B. Provide the action levels that may trigger a change in remediation strategy.	2
7.0	<u>PROPOSED FUTURE ACTIONS</u> Section 21307(2)(e) and Section 21309a(2)(e)	
	A. Provide a schedule for free product evaluation and groundwater sampling.	3
	B. Provide a schedule outlining the next operation and maintenance activities.	3
	C. Provide the date of the next report.	3

**QUARTERLY FREE PRODUCT REPORT
DETROIT DEPARTMENT OF TRANSPORTATION
COOLIDGE FACILITY NO. 00013464
14044 SCHAEFER HWY, DETROIT, MICHIGAN**

FREE PRODUCT DISCOVERY, IMMEDIATE RESPONSE, AND REPORTING

Free Product Discovery

During a groundwater sampling event conducted on April 16, 2003, free product was discovered in monitor well MW-15 (refer to the attached Site Sketch for location) at the site.

Immediate Response Activities

Approximately 1.08 inches of free product thickness was measured and 0.05 gallons of free product were removed from MW-15 (refer to Table 1 for free product elevation data and removal quantities). The free product was removed from MW-15 by hand bailing using a disposable bailer and containerized in a 55-gallon steel DOT approved drum that was properly labeled and stored on-site. Existing monitor wells on- and off-site were gauged during the sampling event and free product was not present in any other monitor wells. In addition, the site was surveyed for possible fire, explosion, and vapor hazards. The results of the survey indicated that no fire, explosion, or vapor hazards were present.

Reporting

The Michigan Department of Environmental Quality (MDEQ) was notified within 24-hours by fax transmittal using the MDEQ Free Product Fax Transmittal form.

Following the May 15, 2003, site visit, monthly site visits have been continued to date. A monthly site visit was conducted on October 9, 2003 to gauge apparent free product thickness and perform free product recovery.

FREE PRODUCT REMOVAL ACTIVITIES

After the discovery of free product in MW-15, the site was monitored for free product on a weekly basis for one month. Since the quantity of free product removed was consistent, the frequency of the free product site monitoring visits was revised to monthly.

Field data obtained from the first monthly (June 26, 2003) free product site monitoring visit indicated a slight increase in free product thickness but not a significant increase. Since then the free product thickness has significantly decreased. Based on this information, the frequency of free product monitoring site visits will continue monthly and free product recovery will be performed by hand-bailing techniques.

The next monthly free product site monitoring visit is scheduled for November 2003. During the site visit, the existing nearby monitor wells on- and off-site will be screened. If it is determined that the quantity or thickness of free product has significantly increased or free product is discovered in other monitor wells, the current free product recovery

method will be revised to an active recovery system. No free product has been observed in any other wells on- or off-site

EXPOSURE PATHWAY EVALUATION

Exposure pathways applicable to the site are consistent with the Final Assessment Report (FAR).

FREE PRODUCT DELINEATION

Free product will be delineated during the installation of the proposed remediation system (as summarized in the Corrective Action Plan of the Amended FAR dated August 28, 2003).

DATA TREND ANALYSIS

Free product elevation data, apparent free product thickness, and quantity of free product removed from April 16, 2003 through October 9, 2003 is presented in Table 1. Graph 1 depicts the static water level elevations of MW-15 versus the apparent free product thickness over time. The results of a free product bail-down test performed at MW-15 can be found in the first quarterly free product report. Graph 2 depicts the apparent free product thickness vs. the groundwater elevations in the existing wells on- and off-site.

FEASIBILITY ANALYSIS ON SELECTION OF RECOVERY SYSTEM

On April 17, 2003, a bail-down test was performed at MW-15. The bail-down test recovery data for MW-15 is provided in the first quarterly free product report dated July 14, 2003. Based on the free product thickness and quantity encountered since October 9, 2003, monthly free product monitoring and recovery by hand-bailing method is appropriate. However, if the results of the free product delineation activities or monthly free product site monitoring indicate an unstable or increasing free product plume, then the current recovery system will be immediately revised to stabilize and reduce the plume.

PERMITTING AND WASTE DISPOSAL TRACKING

Free product recovered from MW-15 to date (a total of 2.72 gallons) was placed in a properly labeled, DOT approved, 55-gallon drum, and stored on-site.

Air quality sampling and calculations are not deemed necessary at this time since the free product is recovered by hand-bailing using a disposable bailer.

PROPOSED FUTURE ACTIONS

Monthly Free Product Monitoring

Monthly free product monitoring and recovery will continue.

Free Product Delineation Activities

The free product plume will be delineated during the installation of the remediation system. Due to system installation delays, the results will be included in the fourth Quarterly Free Product Report.

Next Quarterly Free Product Report

The next Quarterly Free Product Report will be submitted to the MDEQ on or before January 15, 2004.

Coolidge Terminal Draft Categorical Exclusion

Prepared for the
Detroit Department of Transportation

Prepared by
URS Corporation

November 30, 2012

Statement of Limitations

The Coolidge Terminal Categorical Exclusion is a **draft** document and is intended to be a working document for DDOT review. We anticipate comments and encourage your feedback on all aspects of the report. Depending on the comments received from DDOT, there may be another iteration of this level of report to ensure that we are adequately addressing the needs of the work order.

Coolidge Terminal Draft Categorical Exclusion

1.0 PROJECT AUTHORITY

The Detroit Department of Transportation (DDOT) is seeking federal funds from the Federal Transit Administration (FTA) for assistance with the proposed renovation of the Coolidge Terminal bus maintenance facility and, therefore, must comply with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended.

In accordance with 23 CFR Section 771.117(d), the purpose of this written documentation is to assist DDOT in gathering and organizing materials for environmental analysis required under NEPA for the proposed Coolidge Terminal project that may qualify as a Documented Categorical Exclusion. Submission of this information by itself does not meet NEPA requirements. If the project qualifies as a Documented Categorical Exclusion, it must receive written concurrence from FTA.

2.0 PROJECT DESCRIPTION

DDOT is proposing a construction project at its Coolidge Terminal located at 14044 Schaefer Highway in the City of Detroit (See Figure 1 in Appendix A). In January 2012, the Coolidge Terminal temporarily closed pending the completion of the proposed project. The Coolidge Terminal is one of four facilities that DDOT owns and operates to service its bus fleet.

The Coolidge Terminal construction project proposes to modernize and improve existing DDOT equipment, buildings and property, as well as new construction. The proposed project would be contained to the site and upon completion would result in the facility returning to its normal operations. Proposed construction would not result in any additional taking of land; therefore, no acquisitions or relocations are required. The proposed project is a renovation of existing equipment and infrastructure and the construction of new facilities on site. A detailed project description follows.

2.1 DETAILED PROJECT DESCRIPTION

The proposed project includes interior work on the existing buildings, repair and/or replacement of roofs on existing buildings, demolition and removal of the existing fare box building and the existing boiler/power house, the construction of a new fare box building and the construction of an approximately 100,000-square-foot bus storage building on the eastern portion of the parcel (see Figure 2 in Appendix A). Other improvements would include fueling system upgrades, new concrete pavement and curbs, a new guardrail system, upgrades in locker rooms, rehabilitation of the terminal (administration) building, replacement of existing perimeter fencing, a new security system, interior painting and lighting upgrades, new primary electrical service and a new emergency generator system. Approximately one acre of vegetation would be removed including approximately 11 trees ranging in diameter from 4 to 15 inches. Upon completion of the proposed project, the Coolidge Terminal would resume its normal operations. Vehicle activity at the site is not expected to increase in the near future. Vehicular access to/from the site would not change. The proposed project site plans are located in Appendix B.

Specific elements that are part of the proposed Coolidge Terminal project include the following:

- Construction of a new 100,000-square-foot multi-purpose building for the maintenance and storage of the ultra-low sulfur diesel buses.
- Construction of a new fare collection facility.
- New concrete pavement at the site.
- New fueling approaches for the clean fuels fueling area.
- Addition of a “Posi-Lock” fuel system to insure complete fueling of buses.
- Addition of new engine wash equipment for the ultra-low sulfur diesel buses to help prevent overheating and reduce engine wear and maintenance.
- Addition of a new “Clean Fuels” Technology Center to create awareness and a research tool for DDOT staff. The Technology Center will include office areas near the new clean fuels bus storage and maintenance areas.
- Installation of new ultra-low sulfur diesel underground storage tanks and related fuel dispensing equipment.
- New Fuel System Technology for tracking mileage and fuel economy of each bus along with maintenance data and exhaust emissions.
- New fencing and security system.
- Electrical upgrades at the site.
- A new emergency generator system that allows continuous operation during power outages.
- New Hoist equipment and related maintenance items for the new maintenance areas.
- Cleaning and sealing of new and existing garage floors.
- New tail pipe exhaust system.

2.2 LOCATION

The location of the proposed improvements is the site of the existing Coolidge Terminal, located at 14044 Schaefer Highway in Detroit, Wayne County, Michigan.

The facility consists of several buildings concentrated on the western portion of the site as shown on Figure 2. A gate house, terminal (administration) building, and a small building no longer in use stand close to Schaefer Highway. A large complex of connected bus storage, maintenance, and washing buildings occupies the south-central portion of the site and is surrounded by paved areas. A fare box house and a heating plant are located northeast of the complex of buildings. A communications tower and adjacent equipment buildings stand on the eastern portion of the site, which is an unpaved area used for bus parking.

3.0 EXISTING CONDITIONS AND IMPACTS

3.1 METROPOLITAN PLANNING AND AIR QUALITY CONFORMITY

This project falls under funds allocated in the 2012 Transportation Improvement Program (TIP ID#: 2011289). The available funding is a combination of Congestion Mitigation and Air Quality Improvement (CMAQ) program, 5307, 5309 and Comprehensive Transportation Funds for construction of an alternative fuels facility. The community, through the metropolitan planning organization plan and the TIP, is an ozone attainment/maintenance area, a particulate matter

(PM2.5) nonattainment area and carbon monoxide (CO) attainment/maintenance area. The proposed construction would facilitate the presence and use of ultra-low sulfur buses and exhaust gas recirculation technology, which expel less air contaminants than the traditional diesel buses that are currently housed at the site.

3.2 ZONING AND LAND USE

Zoning for the project site is M4 (Intensive Industrial District) and a broad range of uses are permitted in this district. The proposed project is consistent with the current zoning in the project area.

The surrounding area is zoned as M4 to the north and west and R1 Single-Family Residential District to the south and east. Schaefer Highway borders the western edge of the site and a commercial moving and storage company borders the northern edge of the site. The eastern and southern boundaries are lined with residential properties that front on Ward Street and Compass Street, respectively.

The Southeast Michigan Council of Governments (SEMCOG) provided Year 2008 land use data. Using SEMCOG standard colors and land use categories for displaying the data (see Figure 3 in Appendix A), the site of the Coolidge Terminal has a SEMCOG land use designation of “transportation, communication, and utility.” The surrounding area to the north and to the west of the proposed project site is dominated by industrial; commercial; governmental/Institutional; and transportation, communication, and utility land uses. South and east of the site, land use is comprised of single-family residential and transportation. The proposed project is an appropriate use under existing land use designations. Access to/from the site would not change.

3.3 TRAFFIC IMPACTS

The Coolidge Terminal operates 24 hours per day, 7 days per week. The heaviest concentration of activity occurs from Monday through Friday, when a full complement of drivers and mechanics are working at the facility. During this time, mechanics, drivers and other DDOT staff arrive and depart the facility along with DDOT buses that pull-in and pull-out to meet DDOT’s service schedule.

During a typical weekday, it is estimated that approximately fifteen hundred vehicles enter and leave the facility in a 24-hour period. The highest concentrations of vehicles entering and exiting the facility occur during the early morning, early afternoon and early evening hours. The number of mechanics and drivers who report to the Coolidge Terminal on Saturdays, Sundays and holidays are fewer than on regular weekdays. **Table 1** details vehicle traffic at the facility during a typical weekday.

Table 1: Estimated Daily Vehicle Activity at Coolidge Terminal

	Staff Arrivals	Bus Pull-Outs	Bus Pull-Ins	Staff Departures	Total Vehicle Activity
AM Hours					
12:00 – 1:00	30	0	27	61	118
1:00 – 2:00	0	0	7	7	14
2:00 – 3:00	0	0	0	0	0
3:00 – 4:00	9	9	0	0	18
4:00 – 5:00	30	30	0	0	60
5:00 – 6:00	70	70	7	7	154
6:00 – 7:00	32	32	1	1	66
7:00 – 8:00	33	12	1	1	47
8:00 – 9:00	1	1	10	40	52
9:00 – 10:00	0	0	18	18	36
10:00 – 11:00	7	7	17	17	48
11:00 – 12:00	13	13	16	16	58
PM Hours					
12:00 – 1:00	32	32	26	26	116
1:00 – 2:00	32	32	27	27	118
2:00 – 3:00	50	50	19	19	138
3:00 – 4:00	32	32	16	16	96
4:00 – 5:00	46	6	26	48	126
5:00 – 6:00	4	4	23	23	54
6:00 – 7:00	0	0	18	18	36

9:00 – 10:00	3	3	17	17	40
10:00 – 11:00	0	0	9	9	18
11:00 – 12:00	0	0	7	7	14
Total Activity	429	338	330	416	1513

Source: Detroit Department of Transportation.

Sole access to/from the site is from Schaefer Highway at the northwest corner of the site. Schaefer Highway is classified as a principal arterial road. The 24-hour traffic counts from 2008 (latest available data) for the segment of Schaefer Highway from Warren Avenue to 8 Mile Road are presented below in **Table 2**.

Table 2: Schaefer Highway 24-Hour Traffic Counts

Direction	Warren Avenue to 8 Mile Road (2008)
Northbound	4,980
Southbound	4,780
Total	9,760

Source: <http://www.semco.org/data/Apps/trafficcounts.report.cfm>.

Based on the existing (2008) annual average daily traffic of 9,760 and the carrying capacity on Schaefer Highway, no significant adverse impacts on traffic operations on Schaefer Highway or on neighboring residential streets are anticipated with buses and other vehicles entering and exiting the project site. The proposed project would not involve changes in travel patterns or access control to/from the facility. No increase in daily vehicle activity at the site is expected in the near future with the proposed project.

3.4 CO HOT SPOTS

There would not be any traffic problems resulting from this project that would generate CO in excess of applicable standards. In addition, Detroit is a CO attainment/maintenance area.

3.5 HISTORIC RESOURCES

In July 2012, an architectural and historical evaluation was completed for properties on and adjacent to the proposed site. The Area of Potential Effect (APE) included the Coolidge Terminal site (including all buildings on the site) and all properties adjacent to the site. Adjacent properties included residential and industrial properties across Schaefer Highway from the project site, and those that abut the property on its north, east, and south sides. Of all properties within the APE, only the Coolidge Terminal site has been recommended as eligible for the National Register of Historic Places under Criterion A as representative of the City of Detroit's move to modernize the public transportation system in the city during the post-World War II era. A complete discussion of this recommendation can be found in the *Architectural and Historical Evaluation of the Coolidge Terminal, Detroit, Wayne County, Michigan*, Commonwealth Cultural Resources Group, R-1002.01, August 2012, located in Appendix C.

The Michigan State Historic Preservation Office (SHPO) will be consulted regarding the Coolidge Terminal. In the event that an adverse effect to any historic properties is identified as a result of the proposed project, DDOT will enter into the appropriate mitigation as determined by the SHPO. This may include a Memorandum of Agreement or other document that details mitigation measures. A separate Section 4(f) Evaluation may be warranted if the Coolidge Terminal site is determined eligible for the National Register.

3.6 NOISE

Since the function of the site would not be changed by the proposed construction, noise is not anticipated to be an issue. In addition, buses would be housed in an enclosed storage/maintenance facility, which may decrease noise generated at the site.

3.7 VIBRATION

The proposed project would not cause vibration impacts.

3.8 ACQUISITIONS AND RELOCATIONS REQUIRED

Proposed construction would take place on the existing Coolidge Terminal site, therefore, no acquisitions or relocations are required.

3.9 HAZARDOUS MATERIALS

A request to the U.S. Environmental Protection Agency (EPA) to comment on the proposed project was sent via letter on June 15, 2012. In an email dated August 13, 2012, the EPA stated that it “gave the provided materials a cursory review and decided not to provide comments” (see Appendix D for agency coordination letters and responses).

The Michigan Department of Environmental Quality (MDEQ) was also contacted during the preparation of this document. Although the agency did not respond directly, their subcontractor, Gannett Fleming, provided information via telephone relative to the site (Savage, 2012, personal communication) that indicated workers have been on-site at the facility performing environmental investigations, similar to a Phase II site assessment, which includes geotechnical borings and temporary monitoring. It was stated that a feasibility study is also being prepared. Should environmental contamination problems be identified at the site, a proposed remediation plan would be developed to detail the steps that would ensure the community is protected from potential contamination during construction and operation. On-going coordination with the MDEQ, the City’s Department of Environmental Affairs, and other regulatory agencies would occur, as required.

The proposed project includes fueling system upgrades (see plans in Appendix B). The Department of Licensing and Regulatory Affairs (LARA), effective December 2, 2012, administers the underground storage tank (UST) program and the aboveground storage tank program. This program includes regulatory activities and oversight of the design, construction, installation and maintenance of USTs storing regulated substances. The regulations do not require state approval of plans, but do require that the plans be certified. DDOT, as the owner/operator, must submit a notice of proposed installation of USTs, which provides facility and UST details. The review period is 30 days, from date of receipt, to issue a review report on the proposed installation.

The proposed project includes interior work on the existing buildings, repair and/or replacement of roofs on existing buildings, demolition and removal of the existing fare box building and the existing boiler/power house. The buildings at the facility have the potential to contain asbestos since structures constructed prior to the 1970s were potentially built and/or insulated with products that contain asbestos. The proposed project is subject to the notification requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAP), Title 40 of CFR, Part 61, Subpart M, for renovation and demolition projects.

Planned renovations to buildings at the facility and demolition of the fare box building and boiler/power house would be initiated by first conducting a thorough inspection to identify the presence of regulated asbestos containing materials (RACM) and other hazardous building materials (lead-based paint, polychlorinated biphenyl-containing electrical equipment, mercury switches, refrigerants, and the like) that require special handling and disposal.

For planned renovations, if the amount of RACM to be stripped, removed, dislodged, cut, drilled, or similarly disturbed at the facility equals or exceeds the threshold, as outlined in the *Guidance for Submitting Notification of Renovation and/or Demolition Projects*,¹ the project is subject to

¹ Source: MDEQ, *Guidance for Submitting Notification of Renovation and/or Demolition Projects*, September 2005.

the NESHAP regulations and notification is required. A notification must be submitted at least 10 working days before and should describe the upcoming renovation plans and give the scheduled dates of asbestos removal.

For scheduled demolition, notice is required for demolition of all subject facilities, regardless of the amount of asbestos, including those facilities where the asbestos has been removed or has never contained asbestos. If the buildings to be demolished at the Coolidge Terminal (i.e. fare box building and boiler/power house) contain RACM at or above the threshold, the NESHAP requires the RACM be removed prior to demolition. Notification is required 10 working days prior to beginning asbestos removal and demolition. If a building to be demolished contains less than the threshold amount of RACM, notification must be submitted 10 working days prior to beginning demolition. The NESHAP does not require removal of RACM in demolition if the amount is below the threshold.

Renovation and demolition notifications should be sent to the MDEQ Asbestos Program in Detroit.

3.10 COMMUNITY DISRUPTION AND ENVIRONMENTAL JUSTICE

The proposed project would provide enhancements to an existing facility and would not change the land use. The project would not cause any displacements and is not anticipated to disrupt the surrounding community.

Executive Order 12898 (February 11, 1994) directed each federal agency to achieve “environmental justice as part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies and activities on minority populations and low-income populations.” This project is seeking federal funds and is considered a federal project for purposes of compliance with the Executive Order.

Year 2010 Census data and American Community Survey five-year estimates (2006-2010) were used to determine the presence of minority populations and low-income populations within a one-half-mile radius of the site of the proposed project. The results are shown in **Table 3** below, in comparison to the City of Detroit and Wayne County.

Table 3: Minority and Low-Income Populations within the Project Area

	Total Population	Minority Population		Poverty Rate
		Number	Percent	
Coolidge Terminal (½ mile radius)	1,870	1,844	98.6%	33.4%*
City of Detroit	713,777	658,173	92.2%	34.5%
Wayne County	1,820,584	918,404	50.5%	21.4%

Source: Census 2010 SF1 and 2006-2010 American Community Survey five-year estimates

*Poverty rate was calculated using entire Census tract within 0.5 mile of the project site. Census tracts included 5342, 5352, 5353, 5366, 5367, 5371, 5372, 5373, 5377, 5378.

As shown in the table, the percentage of minority populations in the project area is higher than the percentages for both the City of Detroit and Wayne County. The poverty rate for the project area is higher than the county, but is lower than the city. However, with the proposed project,

the site will not function differently from its current use. Additional lighting and presence of security at the proposed site would foster a feeling of safety for the neighborhood. The proposed project would enhance visual quality with removal of deteriorating components of the Coolidge Terminal. Further, with the addition of a new storage facility, buses that were previously stored in the surface lot would now be obscured from view of neighboring properties. Vehicle activity to and from the site is not expected to increase so no additional noise impacts are expected. It is anticipated that the proposed project would not have disproportionately high and adverse human health or environmental effects to any minority population or low-income population.

3.11 USE OF PUBLIC PARKS AND RECREATION AREAS

There are no public parks or recreation areas in the project site or in the immediate vicinity of the facility. Two parks (Sawyer Playground and Adams Butzel Park) are located approximately one-half mile from the site. The proposed project will not impact these resources.

3.12 IMPACTS ON WETLANDS

Based on review of National Wetlands Inventory data, Wayne County Soil Survey, and aerial photography, no wetlands are within or adjacent to the project site; therefore, the proposed project will not impact or encroach into a wetland.

3.13 FLOODPLAIN IMPACTS

Flood Insurance Rate Maps (FIRMs) were examined during the preparation of the Categorical Exclusion (Effective Date February 2, 2012; Wayne County, Michigan, Map Number 26163C0100E). The project site does not lie within or adjacent to a floodplain area. The proposed project would not involve encroachment into a designated floodplain (see FIRM in Appendix E).

3.14 IMPACTS ON WATER QUALITY, NAVIGABLE WATERWAYS AND COASTAL ZONES

There are no potential impacts on water quality, navigable waterways, or coastal zones.

During construction of the proposed project, paved and unpaved areas of the 20-acre site will be disturbed (including clearing, grading and excavation). A National Pollutant Discharge Elimination System permit will be required for this project. Project construction will include installation and maintenance of best management practices for erosion and sediment control to minimize erosion and water quality impacts, including the use of inlet protection.

3.15 IMPACTS ON ECOLOGICALLY SENSITIVE AREAS AND ENDANGERED SPECIES

Approximately one acre of vegetation would be removed including approximately 11 trees ranging in diameter from 4 to 15 inches. This vegetation is located on the eastern portion of the site along the perimeter and consists of turf grass, brush/shrubs and deciduous trees.

A request to the U.S. Fish and Wildlife Service (USFWS) to comment on the proposed project with respect to potential impacts to federally threatened or endangered species or their critical

habitat was sent via letter on June 15, 2012. To date, no response has been received. As an alternative, the guidance on the USFWS Region 3 Section 7 Technical Assistance Web site was followed to fulfill the requirements for consultation under Section 7 of the Endangered Species Act. **Table 4** lists the following federally endangered, threatened, candidate, or special concern species for Wayne County.

Table 4: Wayne County Federally Listed Species

Scientific Name	Common Name	Federal Status	Habitat
<i>Myotis sodalis</i>	Indiana bat	Endangered	Summer habitat includes small to medium river and stream corridors with well-developed riparian woods; woodlots within 1 to 3 miles of small to medium rivers and streams; and upland forests. Caves and mines as hibernacula
<i>Sistrurus catenatus</i>	Eastern massasuga	Candidate	Wet areas including wet prairies, marshes and low areas along rivers and lakes
<i>Dysnomia torulosa rangiana</i>	Northern riffleshell	Endangered	Large streams and small rivers in firm sand of riffle areas; also occurs in Lake Erie
<i>Villosa fabalis</i>	Rayed Bean Mussel	Endangered	Smaller, headwater creeks, but they are sometimes found in large rivers
<i>Plantathera leucophaea</i>	Eastern prairie fringed orchid	Threatened	Mesic to wet prairies and meadows

Source: USFWS County Distribution of Federally Listed Threatened, Endangered, Proposed and Candidate Species, Revised February 2012. <http://www.fws.gov/midwest/endangered/section7/s7process/index.html>. Web site accessed on November 28, 2012.

Additionally, a request was made on June 15, 2012, to the Michigan State University Extension/Michigan Natural Features Inventory (MNFI) for a rare species review. In a letter dated June 20, 2012 (see Appendix D), the MNFI concluded that, “it is highly unlikely that listed species will be impacted by this activity.”

It is anticipated that due to the urban nature and current industrial use of the site, there would be no adverse impacts to endangered species or ecologically sensitive areas. Suitable habitat is not present in the proposed action area; therefore, species and critical habitat are not present.

3.16 IMPACTS ON SAFETY AND SECURITY

The proposed project would improve safety and security at the site by providing bus storage, lighting, fencing, and a new security system. The new construction and upgrades to the existing facilities on the site would also contribute to the feeling and reality of safety and security in an area of Detroit that suffers from a lack of productive development and a high instance of vacant properties.

3.17 IMPACTS CAUSED BY CONSTRUCTION

Construction impacts will be minimal, as the proposed construction will take place entirely within the existing site. Adjacent residential neighborhoods may experience a temporary increase in noise and may also experience temporary visual effects, both due to presence of construction equipment and activities.

The facility is currently closed and would remain closed during construction activity. The overall traffic flow in the vicinity of the project site will be maintained during the construction period.

3.0 MITIGATION

During the construction phase of the Coolidge Terminal project, all construction activities are specified to be performed in such a way as to minimize to the greatest extent feasible, any noise, air quality and water quality impacts. Temporary short-term increases in noise levels are anticipated during the construction period. Construction noise would be controlled by limiting noise-generating activities to daylight working hours. To reduce noise levels during that period, construction equipment would be kept in good repair to ensure that proper noise muffling is maintained. Heavy construction, such as demolition, would be performed during a limited time period so the community would not be adversely impacted. Standard noise and dust specifications would be followed, in addition to adherence to local ordinances. To reduce the emission of criteria pollutants, fuel-burning equipment running times would be kept to a minimum and engines would be properly maintained. Equipment and machinery installed at the proposed project site would meet all Federal, State, and local noise regulations. Temporary short-term impacts to surface waters could occur during the construction period due to storm water runoff from the site. To reduce potential impacts related to water quality, appropriate best management practices would be implemented during construction, such as installing fabric barriers at storm drain inlets.

Excavation activities could expose or otherwise affect subsurface hazardous wastes or materials; any hazardous materials discovered, generated, or used during construction would be disposed of and handled in accordance with applicable Federal, State and local regulations. Disposal of excess material would be in compliance with the guidelines listed in the standard specifications, and would not occur in wetlands, floodplains, or other sensitive areas. Erosion and sedimentation would be controlled in accordance with an erosion control plan.

No detours on area roadways are anticipated during construction. The appropriate signage and barriers would be in place prior to construction activities to alert pedestrians and passing

motorists of project activities. There would be no disproportionate health and safety risks to minority populations or low-income populations.

The proposed project would consider opportunities to use “green” building concepts in the design and specifications of material for the project. The proposed project would use Leadership in Energy and Environmental Design (LEED) principles, as defined by the United States Green building Council (USGBC), for areas where cost-effective green buildings concepts can be used on the facility design and construction.

There are no displacements with the proposed facility renovations; therefore, no relocation measures would be necessary.

All necessary permits would be obtained and permit conditions would be implemented.

The action described above meets the criteria for a NEPA categorical exclusion in accordance with 23 CFR Part 771.117(d).

CONTROL SYSTEM GENERAL NOTES

1. THE OPERATOR MUST CONSULT WITH THE UTILITY OFFICE OF THE NATIONAL GRID, DETROIT, MI, FOR ALL APPLICABLE FEDERAL, STATE AND LOCAL CODES AND REGULATIONS.
2. THE SAFETY REPRESENTATIVE WILL VERIFY THE CONTROL PANEL, INCLUDING ALL THE SAFETY COMPONENTS, BEFORE BEING ALLOWED FOR ALL EQUIPMENT AS REQUIRED.
3. THE TOOL REPRESENTATIVE/SAFE REPRESENTATIVE WILL BE RESPONSIBLE FOR APPROVING SAFE FOR CONSTRUCTION AND SAFE REPRESENTATIVE FOR THE SAFETY OF THE WORKERS AT OTHER SITES.
4. POWER SOURCE MUST BE IDENTIFIED IN CONTROL SCHEMATIC FROM PANEL AND CONTROL WIRE CONNECTIONS. ALL IDENTIFIABLE DATA WIRING SHALL BE IN CONTROL SCHEMATIC AND CONTROL WIRE IDENTIFICATION WILL BE IDENTIFIED BY A NUMBER OR 'F' FROM ALL OTHER ELECTRICAL DRAWINGS.
5. REFER TO THE IDENTIFICATION DATA SHEETS WITH THE EQUIPMENT FOR THE SAFETY OF THE OPERATOR AND PROTECTIVE DEVICES TO BE USED WITH THE EQUIPMENT. THE SAFETY OF THE OPERATOR AND PROTECTIVE DEVICES TO BE USED WITH THE EQUIPMENT WILL BE IDENTIFIED BY A NUMBER OR 'F' FROM ALL OTHER ELECTRICAL DRAWINGS.
6. LOW VOLTAGE AND HIGH VOLTAGE SAFETY REPRESENTATIVE CONTROL SCHEMATIC WILL BE IDENTIFIED BY A NUMBER OR 'F' FROM ALL OTHER ELECTRICAL DRAWINGS.
7. OTHER ELECTRICAL DRAWINGS MAY APPLICABLE CONTROL CLASS 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.
8. OTHER SAFETY RELATED AND POWER REPRESENTATIVE WILL BE IN VEHICLE-ROOT CONTROL SCHEMATIC. POWER SOURCE IDENTIFICATION WILL BE IDENTIFIED BY A NUMBER OR 'F' FROM ALL OTHER ELECTRICAL DRAWINGS.

KEYED ELECTRICAL DEMOLITION NOTES:

- 1. EXISTING EXISTING PUMP CONTROL TO BE DEMOLISHED AND NEW PUMP CONTROL TO BE INSTALLED IN LANE 1 TO BE DEMOLISHED.
- 2. EXISTING PUMP CONTROL TO BE DEMOLISHED AND NEW PUMP CONTROL TO BE INSTALLED IN LANE 1 TO BE DEMOLISHED.
- 3. EXISTING PUMP CONTROL TO BE DEMOLISHED AND NEW PUMP CONTROL TO BE INSTALLED IN LANE 1 TO BE DEMOLISHED.

ABSTRACT

In 2012, Commonwealth Cultural Resources Group, Inc. (CCRG) was hired by the URS to update the 2003 Historic Evaluation of the Coolidge Terminal, City of Detroit, Wayne County, Michigan. The proposed project is receiving federal funding from Federal Transit Administration (FTA) and, therefore, must comply with the National Environmental Policy Act and Section 106 of the National Historic Preservation Act of 1966, as amended. The analysis focused on the effects of the proposed project on the social, natural and built environment.

The Coolidge Terminal facility construction project proposes to modernize and improve existing D-DOT equipment, buildings and property, as well as new construction. The proposed project would be contained at the site and upon completion would result in the facility returning to its normal operations. Included in the proposed plan are interior work on the existing buildings, repair and/or replacement of roofs on existing buildings, demolition and removal of the existing fare box building and the existing boiler/power house, and the construction of a new fare box building and coach storage building. Other improvements would include fueling system upgrades, new concrete pavement and curbs, new guardrail system, upgrading locker rooms, rehabilitation of the terminal (administration) building, replacement of existing perimeter fencing, a new security system, interior painting and lighting upgrades, new primary electrical service and a new emergency generator system.

CCRG carried out a site visit to the Coolidge Terminal facility in April 2012, during which the property was extensively toured and photographed. At the same time, a review of the project Area of Potential Effect (APE) was completed. The APE identified by CCRG remains the same as was identified in 2003 for a project carried out by Ms. Betsy Bradley of URS, and includes only those properties immediately adjacent to the Coolidge Terminal or those directly across the street from the facility on Schaefer Highway. Additional background material was sought and the property history updated to include information on the 2011 fire at the facility.

As a result of the work carried out by CCRG, it was determined that the Coolidge Terminal property does meet the National Register of Historic Places Criteria for Evaluation under Criterion A as representative of the City of Detroit's move to modernize the public transportation system in the city during the post-World War II era. This decision means that the two planned building demolitions will have an adverse effect on the property as will the planned new Fare Building construction. No cultural resources within the APE outside the Coolidge Terminal meet the NRHP Criteria for Evaluation and therefore would not be affected by any of the planned activities.

TABLE OF CONTENTS

Abstract.....	ii

1.0 INTRODUCTION

In 2012, Commonwealth Cultural Resources Group, Inc. (CCRG) was hired by the URS to update the 2003 Historic Evaluation of the Coolidge Terminal, City of Detroit, Wayne County, Michigan. The proposed project is receiving federal funding from FTA and, therefore, must comply with the National Environmental Policy Act and Section 106 of the National Historic Preservation Act of 1966, as amended. The analysis will focus on the effects of the proposed project on the social, natural and built environment. Therefore, a review is required to determine if the proposed project may affect any historic properties that are eligible for listing in the National Register of Historic Places (NRHP).

The Coolidge Terminal facility construction project proposes to modernize and improve existing D-DOT equipment, buildings and property, as well as new construction. The proposed project would be contained at the site and upon completion would result in the facility returning to its normal operations. Proposed construction would not result in any additional taking of land; therefore, no acquisitions or relocations are required.

The proposed project includes interior work on the existing buildings, repair and/or replacement of roofs on existing buildings, demolition and removal of the existing fare box building and the existing boiler/power house, and the construction of a new fare box building and a coach storage building. Other improvements would include fueling system upgrades, new concrete pavement and curbs, new guardrail system, upgrading locker rooms, rehabilitation of the terminal (administration) building, replacement of existing perimeter fencing, a new security system, interior painting and lighting upgrades, new primary electrical service and a new emergency generator system.

The Coolidge Terminal property project is located at 14044 Schaefer Highway, Detroit, Michigan (Figure 1.0-1). Geographically, this is in the SW ¼ of Section 20, T1S/R11E, Greenfield Township, Wayne County. The site is located east of Schaefer Highway just north of Schoolcraft Street and south of Lyndon Street. The historic assessment documents the Terminal Building, Bus Storage Building, Bus Maintenance Building, Bus Washing Building, Gate House, Heating Plant, Fare Box House, Communications Tower, and an unused Dispatch Building. Additionally, properties within the surrounding study area are defined and assessed.

1.1 PROJECT METHODOLOGY AND NATIONAL REGISTER OF HISTORIC PLACES CRITERIA OF EVALUATION

The documentation of the Coolidge Terminal was undertaken in several phases. Initial work included gathering basic background information from the Library of Michigan, Lansing; the Burton Historical Collection, Detroit Public Library; and through review of previous documentation and online materials.

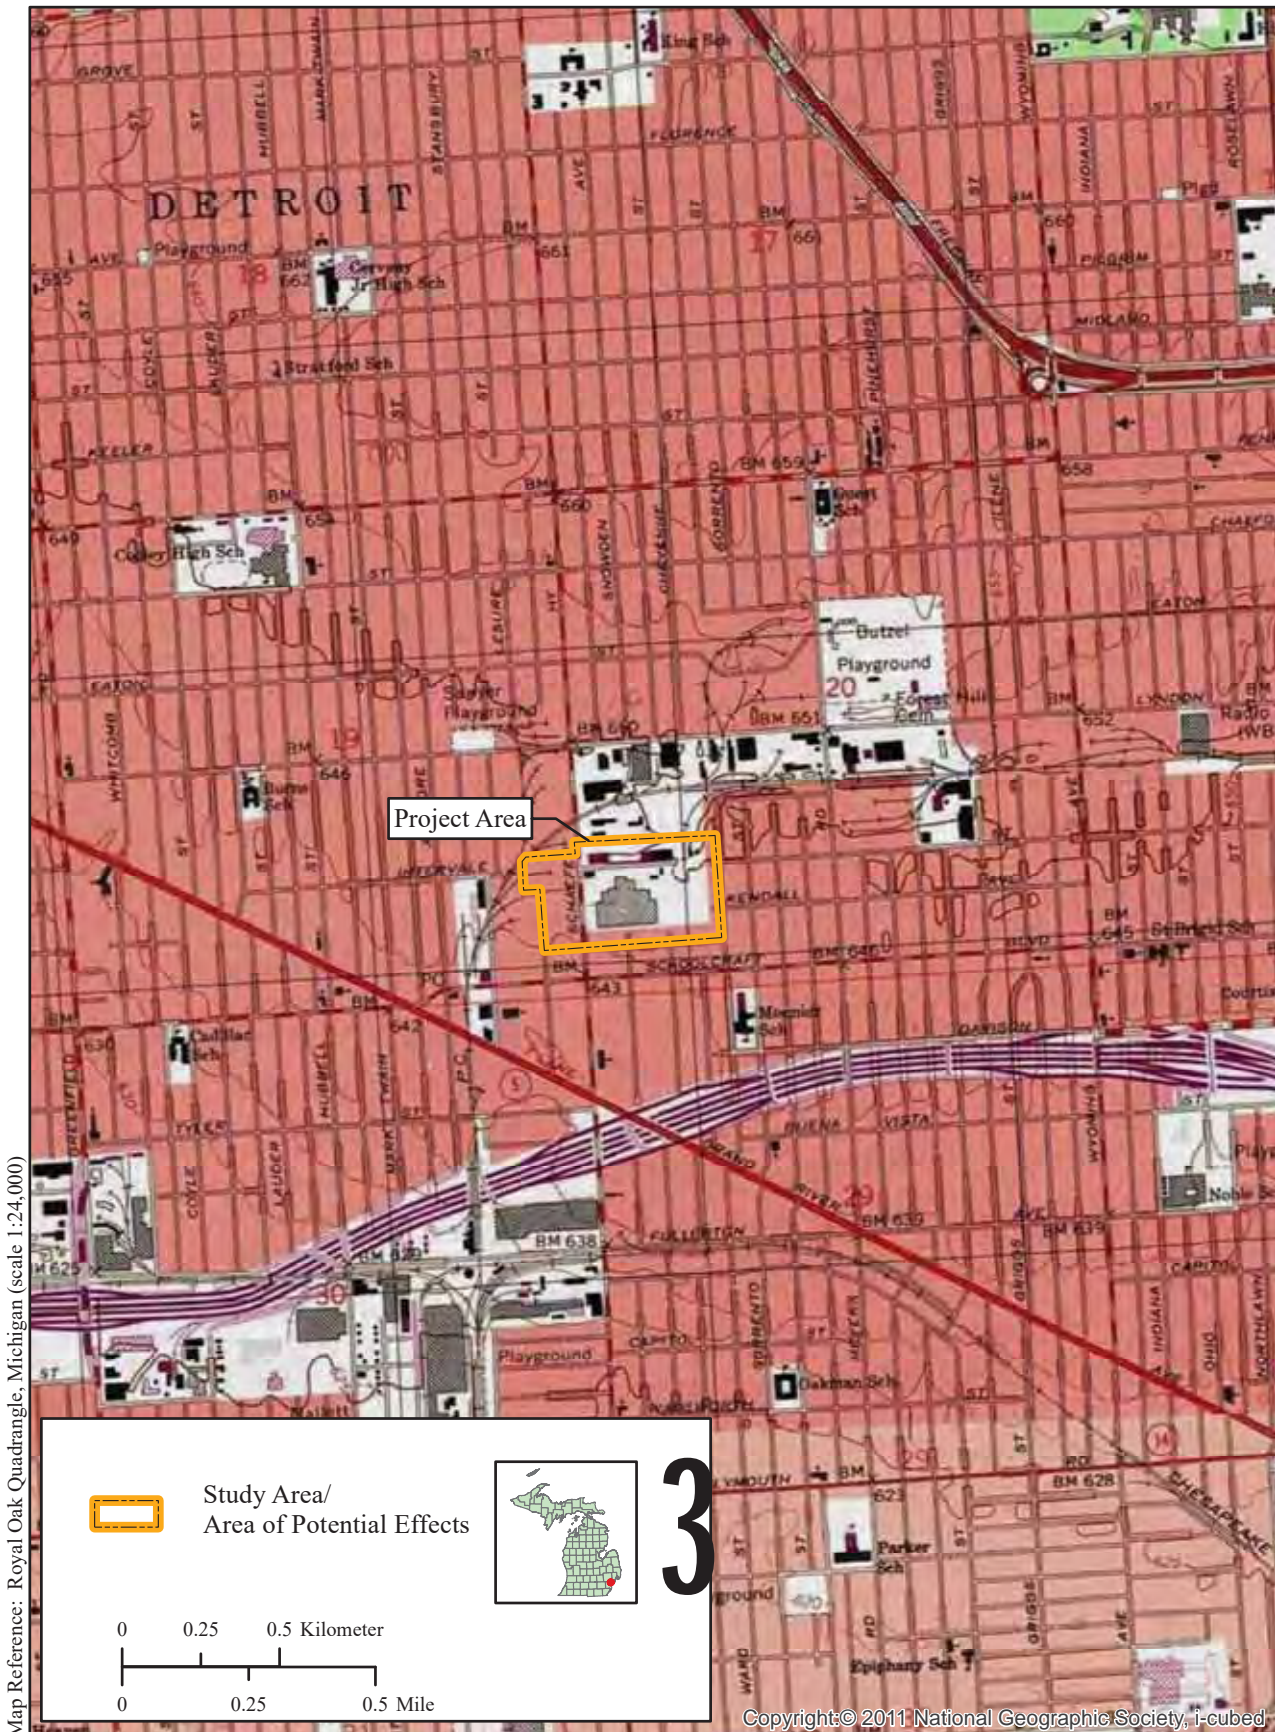

Figure 1.0-1. Coolidge Terminal Location

Upon the completion of gathering the background information, a visit was paid to the Coolidge Terminal site and the surrounding area. Here, photos of the property were taken, notes on the associated resources compiled, and a sketch plan of the site completed.

It was during this phase of the research that the appropriate area of potential effects (APE) for the project was determined to be limited to those properties that are immediately adjacent to, or within the viewshed of, the Coolidge Terminal site. This includes dwellings on the north side of Compass Street, south of the Coolidge Terminal; west side of Ward Street, east of the Coolidge Terminal; and both west and east side of Schaefer Highway between Compass Street on the south and the property immediately north of the Coolidge Terminal at 14226 Schaefer Highway (Figure 1.1-1). Each of the properties within the APE was also surveyed, from the public-right-of-way, including photographs and notes on historic integrity.

As previously stated, the primary purpose of examining the Coolidge Terminal was to determine its eligibility for listing in the NRHP. To be eligible for listing in the NRHP, a resource must typically be 50 years old or older. It must also exhibit integrity of location, design, setting, materials, workmanship, feeling, or association and meet one or more of four NRHP criteria:

- A. Association with events that have made a significant contribution to the broad patterns of history;
- B. Association with the lives of persons significant in the past;
- C. Embodiment of distinctive characteristics of a type, period, or method of construction; representative of the work of a master; possession of high artistic values; or representation of a significant and distinguishable entity whose components may lack individual distinction; or
- D. Ability to yield information important in prehistory or history.

1.2 ORGANIZATION OF THE REPORT

Chapter 1.0 introduces the project and provides background on the survey methods. Chapter 2.0 presents historical background for the development of Coolidge Terminal. Chapter 3.0 presents the description and architectural/historical evaluation of the facility, as well as the integrity assessment and NRHP evaluation. Chapter 4.0 offers conclusions and recommendations. Chapter 5.0 contains a comprehensive list of references cited in the body of the report. Appendix A is a full set of survey forms for the Coolidge Terminal and the buildings in the surrounding Area of Potential Effect (APE). Appendix B includes images of the properties located in the APE. Appendix C includes project plans.

Evelyn Tidlow served as the project manager. Elaine Robinson served as the principal investigator and primary author of the report. James Montney prepared the supporting graphics.

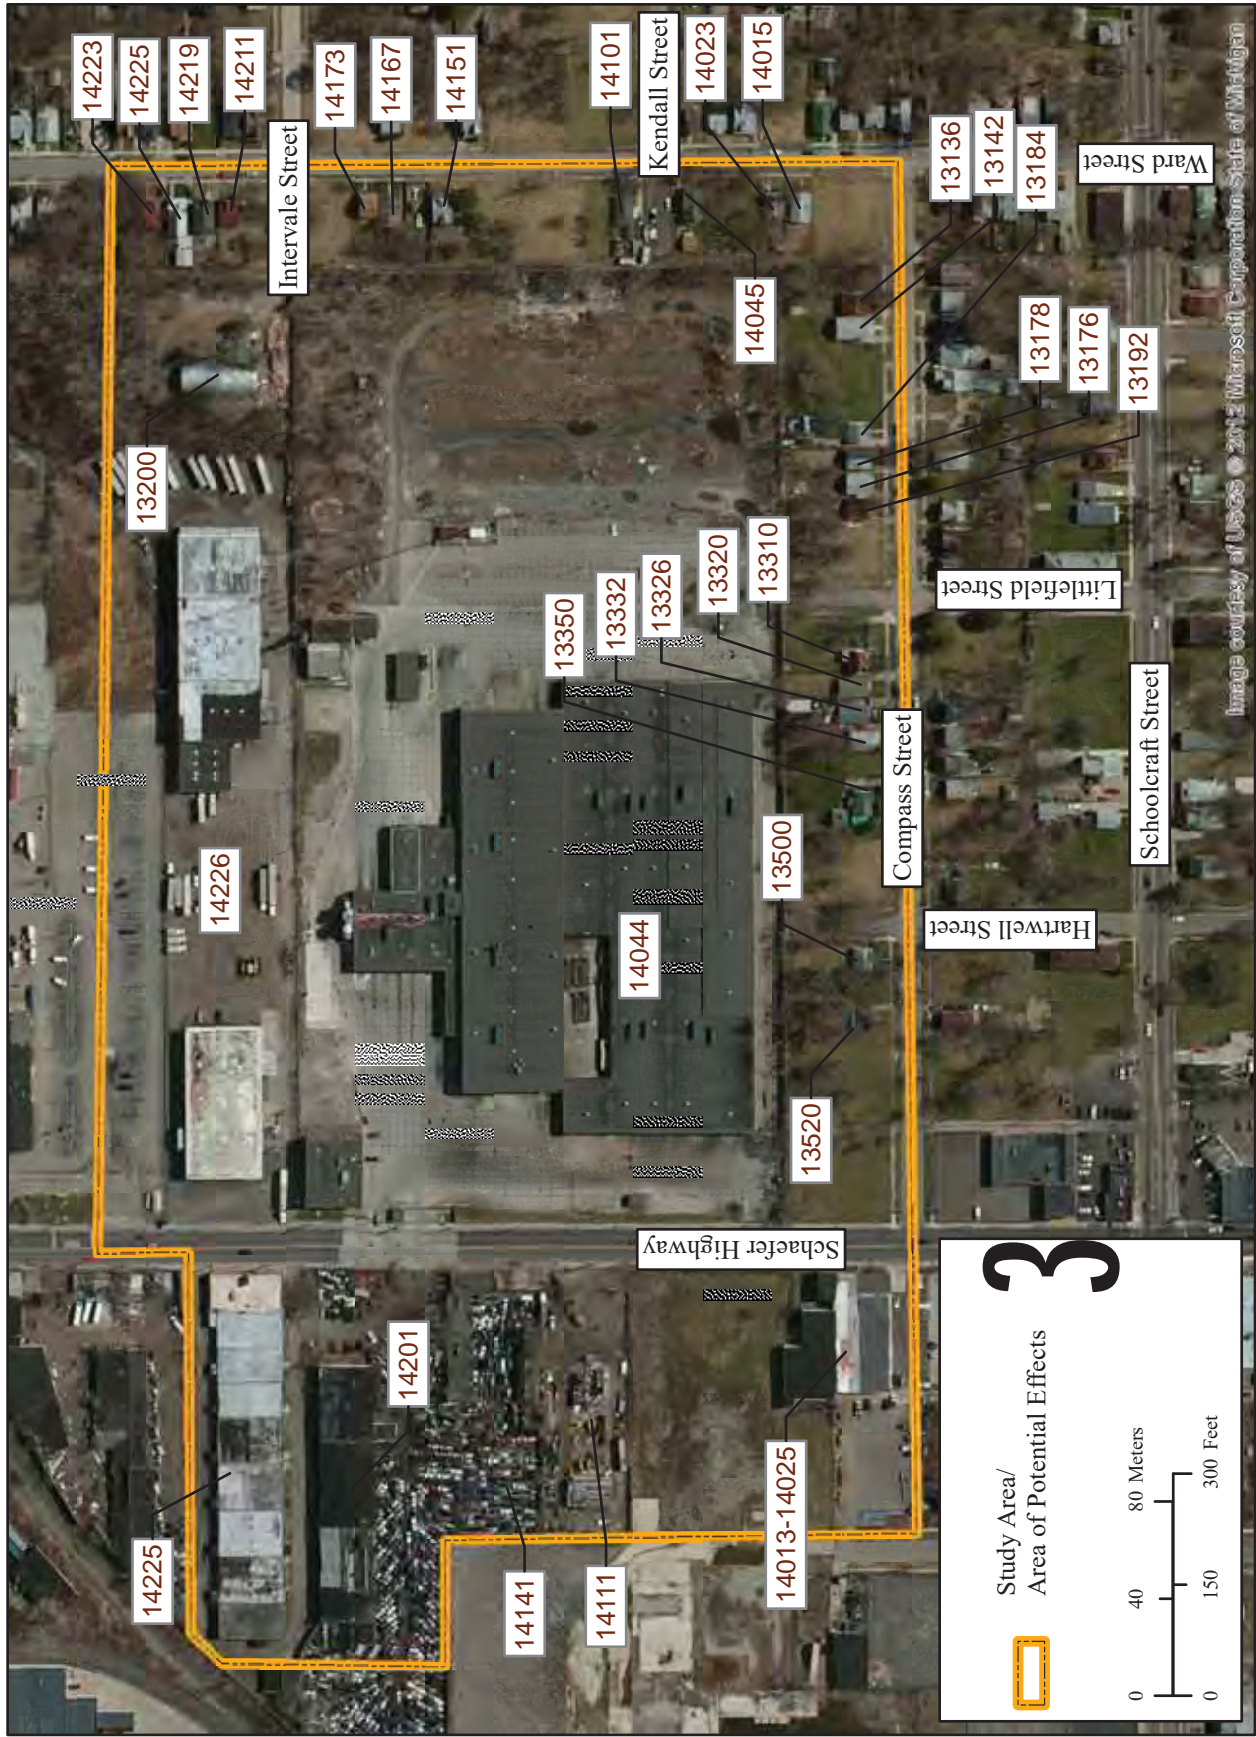

Figure 1.1-1. Coolidge Terminal Study Area/Area of Potential Effects

2.0 HISTORIC CONTEXT

2.1 AREA DEVELOPMENT

The Coolidge Terminal site is located in Section 20, T1S/R11E. Originally known as Greenfield Township, the township was annexed by the City of Detroit in 1926 (United States Department of Commerce 1931:532). Plats were filed for the area south and east of the Coolidge Terminal property between 1914 and 1916. These areas include the properties within the project APE on Compass and Ward streets (Figure 2.1-1 to 2.1-3). There are two plats filed for the west side of Schaefer Highway, Plat of Josapine (sic) Caplers Estate in Greenfield and Christian Perrot's Subdivision of Lot or Devise No. 2 of Josephine Caplers Estate on Sections 19 and 30 (Figures 2.1-4 and 2.1-5) (Greenfield 1892, 1913). The Josaphine Capler's Estate plat was filed in 1892, while the subdivision was made in 1913.

Over time, there have been some changes to the original plats. For instance, in the Happy Homes Subdivision, the plat lists Monnier Road, which was subsequently called Coolidge Highway (thus giving the name to the bus terminal) and later to Schaefer Highway (Greenfield 1914). Additionally, Liberty Avenue is now known as Compass Street. In the Greenlawn Subdivision and Greenlawn Subdivision No. 1, Helmuth Avenue is now known as Ward Street. Finally, in the Greenlawn Subdivision No. 1 plat, Emily Avenue is known as Gravel Street (Greenfield 1915a, 1915b).

The area around the Coolidge Terminal includes both commercial/industrial and residential properties (see Figure 1.1-1). For the most part, the commercial/industrial properties are limited to lining both sides of Schaefer Highway. All of the residential properties are located on either Compass Street south of the Coolidge Terminal or Ward Street to the east of the terminal property. The lone exception to the division of commercial/industrial and residential is the former Smith Bros. Electric shop at 13200 Intervale Street. The property, which was constructed in 1946, appears to be vacant in 2012 (Bradley 2003:4-3).

As is noted above, the platted sections of the APE were established in the mid-1910s, although it appears that the earliest buildings in either the commercial/industrial areas or residential sections of the APE were erected in the mid-1920s. In addition to the complex of structures associated with the Coolidge Terminal, there are seven commercial/industrial buildings in the APE and 24 residential properties in the APE. Construction of these resources occurred in two major waves of development, with the first taking place between 1922 and 1929. During this time, two of the commercial properties were erected and 14 of the residential buildings. The next major phase of development began in the late 1930s and extended to approximately 1960. These buildings take into consideration the post-World War II building boom and include four of the commercial/industrial buildings and nine of the residential structures. Only two of the properties in the APE were constructed after 1960, including one commercial/warehouse and one residence, both constructed ca. 1970. Given that the most recent completed building in the APE was erected ca. 1970, this means that all of the above-ground resources are over 40 years old and therefore need

2.2 DETROIT STREET RAILWAY TO DETROIT DEPARTMENT OF TRANSPORTATION

2.2.1 Detroit Street Railway

The City of Detroit was established in 1702, and by 1845 the first public hacks (or horses available for hire) were on the streets of the community. Just two short years later a line of street omnibuses was introduced principally running along Jefferson Avenue (Catlin 1926:573). Street railways were introduced in New York featuring horse-drawn cars along a line built in 1832-1833 (Catlin 1926:573). In Detroit, the first street railway franchise was granted on May 24, 1862. Over the next quarter-century, the streetcar industry grew dramatically across the city, with Detroit boasting several privately held companies that provided transportation services. These firms were granted permission by the city of Detroit to carry out business within the city but were owned and operated entirely by private enterprise. Even when most of the streets of the city were unpaved or paved with decaying or decayed cedar blocks laid on a dirt foundation, streetcar tracks were located in the center (Caitlin 1926:593). Early transportation systems included horse-drawn cars on Jefferson and Woodward avenues. By the final decade of the century, electric streetcars were introduced and a few years later trolley lines utilizing the technology replaced the earlier horse-drawn lines (Bradley 2003:3-1).

In 1892, Detroit mayor Hazen S. Pingree advocated for a municipally owned street railroad system (Bradley 2003:3-1); however, obstacles including legal battles, a state constitution amendment, and revised Detroit City Charter resulted in the move being delayed for almost four decades. Finally, in 1920, the citizens of Detroit voted to construct municipal lines and the city then purchased extant rail lines from the private operating companies. On May 15, 1922, the City of Detroit's Detroit Street Railway (DSR) began operation under the auspices of the Street Railway Commission (Department of Street Railways [DSR] 1938:30).

Under the new ownership of the DSR, Detroit's street railway system expanded to include the Shoemaker Car House in 1922 and the Coolidge Car House in 1928. By 1930, the City of Detroit operated the largest street railway system in the United States (Bradley 2003:3-1). Not surprisingly, ridership on the DSR peaked in the late 1920s (O'Geran 1931:xiii).

2.2.2 Transition to Coaches

One of the ways that widespread voter approval for the establishment of the municipally owned DSR was achieved was the promise that they would soon establish transit service to the newly settled subdivisions surrounding Detroit (Schramm et al. 1980:29). To do this, first the construction of the lines needed to be completed. This proved to be a huge problem particularly with the growing cost of rail lines. To solve this issue, the DSR turned instead to the motor bus, or coach as they were known at the time.

In spite of the cost savings by the use of coaches over the miles and miles of new rail construction, then-Mayor James Couzens felt that the reliability of the automotive industry at the

time would not support the type of service required by Detroit. Given that Couzens was considered to be an expert on rubber-tired transportation due to a former association with the Ford Motor Company, his opinion held some sway. As a result, the earliest attempt to operate a bus by the DSR came on November 19, 1922 (Schramm et al. 1980:29). The first line established served the Dodge Export Plant formerly accessible by the Lynch Road Line. The plant, constructed as an ordnance plant during World War I, was originally served by the Detroit United Railway (DUR) but discontinued after the Armistice, when business gradually fell off. By October 1921 the rail service was discontinued and the tracks removed (Schramm et al. 1980:29). At the request of the Milwaukee Junction Manufacturers Association, service was reinstated on the line using three single-decker buses.

These first buses included two rented vehicles and a new Fageol coach purchased for \$7,000.00 (Schramm et al. 1980:29). In spite of the request to maintain the line, with the five-cent fare and providing no transfers to another line, the DSR was unable to make the line pay. Eventually the service was assumed by a competing company who raised the rates. By November 8, 1924, the DSR re-laid the original track and the route continued using streetcars (Schramm et al. 1980:29). Just a few months later, the first permanent bus line opened as an extension of the Mack car line. This route utilized Dodge-Graham coaches and operated from Hart Loop to the new city limits at Cadieux Road.

At the same time the DSR was getting its coach systems up and running, there were several competitive systems in the Metro Detroit area. The first, Detroit Motorbus, operated inside the city limits, and was the firm that assumed control of the Lynch Road Line in 1923. This firm had its rights to operate within the city limits revoked in January 1932 and the DSR assumed all routes they had established. Meanwhile, several suburban based bus lines were organized. These included Lakeshore Coach Lines operating in the Grosse Pointe area and the Dearborn Coach serving the western suburbs (Schramm et al. 1980:53). These lines remained separate from the DSR and operated as part of the Southeastern Michigan Transportation Authority (SEMTA). The two services operated in conjunction with each other, with DSR operating only in the City of Detroit, and SEMTA buses using a “closed door” after entering the city limits to restrict competition.

In the 1930s the popularity of the bus over the streetcar continued to grow. Initially streetcar lines were manned with small buses (carrying about 25 passengers each) during evening and weekend hours. The use of buses also helped the DSR deal with a growing labor expense problem, bypassing the union’s demand that their contract required two-man crews, a motorman and conductor. By 1939 the DSR had rail-bus service on 20 lines and three lines converted entirely to buses (Bradley 2003:3-2). As older equipment began to require replacement, the DSR again made the decision to replace with buses, acquiring 800 buses by the end of the decade (DSR 1937:4; Schramm et al. 1980:64, 65, 71).

The 1945 annual report of the DSR boasted that the agency was the “first of Detroit’s municipal departments to unfold a completely practical and startlingly modern post-war improvement plan” (DSR 1945:23). On August 19, 1945, not long after VJ Day and the end of World War II, the

DSR announced their plans to modernize bus service. This would be the last time that public transportation would figure higher in regional planning than the development of freeways and the accommodation of private automobiles (Bradley 2003:3-2).

The plan announced by the DSR included the purchase of 80 streetcars and over 300 of the larger 45-passenger buses (DSR 1945:23-37). This occurred about the same time planning for the improvements or new designs for Grand River, John C. Lodge, Hastings, and Crosstown expressways had been approved and scheduled for construction. Part of the plan also included the construction of at least seven DSR terminals, such as the Coolidge Terminal, at strategic places in the outlying areas of the city. Additionally, the plan called for the construction of surface parking lots for passengers to gather in outlying areas of the city, high speed bus lines, and downtown sub-surface terminals associated with underground pedestrian concourses. The later action would move pedestrian traffic away from congested streets resulting in better driving conditions for everyone (DSR 1945:23-27).

Although plans were developed, there were a number of obstacles working against their implementation. Strikes, litigation, material and equipment shortages, and the industrial conditions of the post-war period slowed the plan. In spite of these delays, in 1946 the first components of the modernization plan were underway, including the construction of a 200-coach service and storage garage at the old Shoemaker Car House (DSR 1946:4, 9). Firmly behind the modernization program, in March 1946, the Street Railway Commission approved the development of the Gilbert Terminal to service buses. This move also prompted the reconstruction of the Coolidge Terminal, converting it from streetcar to bus service (Schramm et al. 1980:87, 89).

The Gilbert and Coolidge terminals were essential to keeping the growing fleet of buses serviced and running. At the end of each day on the road, buses were serviced and their operating conditions assessed. Full inspections were scheduled for 3,000- and 6,000-mile intervals with more extensive work done every 50,000 miles, and automatic washing bays allowed for the washing of coaches at least once a week (DSR 1947:15-16). The Gilbert and Coolidge terminals could carry out the smaller checks on buses, but for more extensive work and repair projects the coaches were taken to the shop at the Highland Park Terminal. With the addition of the new terminals and repair facilities, the DSR was able to even further expand their number of coaches to just under 2,300 in 1948 (DSR 1948:5).

As part of the modernization program, in 1947 the DSR decision to abandon streetcar service on all but one of the routes called for the use of 40 to 50 passenger buses (*Bus Transportation* 1947:87). When confronted with criticism that this move would put men out of work the DSR responded by pointing out that buses carried fewer passengers than the streetcars resulting in an increase in the number of vehicles needed to service a route.

2.2.3 Detroit Department of Transportation

On July 1, 1974, under the new City of Detroit charter, the former DSR became Detroit Department of Transportation, or D-DOT (DSR Coach Lines History, Excerpts and Miscellaneous, Part 2, Burton Historical Collection, Detroit Public Library, Detroit). This move replaced the three-man commission with a seven-member advisory commission that could only make recommendations about the D-DOT but had no operating authority (Schramm et al. 1980:271).

2.3 COOLIDGE TERMINAL PROJECT

2.3.1 Harley, Ellington and Day, Architects and Engineers

The three partners in the firm of Harley, Ellington and Day, came together over a long period of time. The first of the partners to make his way to Detroit was Alvin E. Harley, who moved in 1890 as a young man with his family from his birthplace in Manitoba, Canada, to London, Ontario, a point about half-way between the two industrial cities of Buffalo, New York, and Detroit, Michigan (Harley Ellis Devereaux [HED] 2008:3). Due to the greater opportunities in the city, Harley was able to gain work as a draftsman, firmly establishing his career path toward architecture. In 1903, at the age of 19, Harley relocated to Detroit, where he took an apprenticeship first with the firm of Albert Kahn and later George D. Mason (HED 2008:5).

By 1908, Harley established his first architectural firm with fellow Mason firm alumnus Norman Atcheson. This firm was responsible for designs of the 1912 Globe Theater on Grand River at Trumbull and the Henry Clay Hotel on Centre Street near Grand Circus. The firm lasted just four years, ending in 1912 when Harley established his solo practice (HED 2008:7). Just two years later Harley won a major commission to design and construct an English cottage-style structure in Bloomfield Hills for Hugh Chalmers, founder and president of Chalmers Motor Company (HED 2008:7). This commission launched his career as a designer for the city's elite, including residences in the newly established Detroit neighborhood of Palmer Woods, Grosse Pointe Park, and Bloomfield Hills (HED 2008:7-8). Although the residential business was lucrative, Harley was also able to complete a number of commercial and industrial buildings during the same time period.

During the early career of Harley, another young designer was getting his start in Chicago. Harold Slight Ellington studied engineering at the Armour Institute (now Illinois Institute of Technology), graduating in 1908 (HED 2008:9). Early career efforts included working as the chief engineer for Standard Concrete Construction Company. Here Ellington designed reinforced concrete structures for buildings, bridges, and breweries. By 1912, his efforts with breweries provided an opportunity for Ellington to work for Julius Stroh as the plant and construction manager for Stroh Brewing Company (HED 2008:9). In 1917, when Prohibition took effect in Michigan, Ellington was able to transfer his efforts as construction engineer to J. B. Book and his brothers. While the association with the Book Brothers only lasted two years, it provided ample opportunity for Ellington to gain expertise in the design of modern office

buildings, such as the 14-story Book Building and the 22-story Washington Boulevard Building (HED 2008:10).

In 1912 Ellington moved to Detroit and eventually entered the firm of Giaver, Dinkelberg and Ellington, Architects and Engineers. This firm lasted only a few years, and Ellington moved on to partner in the firm of Weston and Ellington (HED 2008:11). This firm gained prominence working on health care projects, including several nurses residences associated with Detroit area hospitals, and later the Burtha Fisher Home for the Aged and the Sarah Fisher Home for Children. Weston and Ellington was also known for their industrial designs, including commissions for Howard Flint Ink Company and a series of pumping stations and service garages for the Detroit City and Gas Company (HED 2008:12).

With the advent of the Great Depression, like most architectural and design firms, Weston and Ellington were struggling as they entered the 1930s. Then, in 1932, Weston died, leaving Ellington without a partner. This was about the same time that Alvin Harley was also struggling having based much of his business in the 1920s on construction of massive residences. The shared circumstances drew Haley and Ellington together, who agreed in 1933 to merge their businesses, naming the new firm Harley and Ellington, Architects and Engineers (HED 2008:13). Among the projects that are attributed to Harley and Ellington are the Book Building, Stroh Building, Real Estate Exchange Building, and the Stroh Products Company (Romig 1935).

In 1943, the third partner of Harley, Ellis and Day joined the firm. Clarence E. Day Sr., a native of Detroit, spent his early career designing homes for the area's social elite, including officers of Ford and General Motors. Traveling extensively in Europe for inspiration, Day worked in a variety of styles, but is perhaps best known for the Tudor Revival style residence known as Moulton Manor, the home of William E. and Nina Scripps in Lake Orion, Michigan (HED 2008:19). Like other professionals of the same time period, the Depression greatly curtailed his business, and Day disbanded his company and worked from his home between 1935 and 1937, where he turned his attention to large-scale residential projects. This effort resulted in working with Harley and Ellington on the Frederick Douglas homes in 1942, and ultimately paved the path to partnership for the men (HED 2008:19).

Working together, the firm expanded their practice winning projects such as the design of a new hospital in Macomb County, cemeteries and mausoleums around the county, and the design and construction of the 16 buildings that formed the Coldwater (Michigan) State Home and Training School (HED 2008:21). In the mid-1940s the firm began a long-term association with the University of Michigan gaining a reputation for its work on civic and cultural buildings. This experience led to the commission to design Detroit's Veterans Memorial Building, and their role in redesigning Detroit's transportation system, including renovations to Detroit's Fort Street Union Rail Depot, the design of six new garages for the Detroit Department of Street Railways, and in 1948, Detroit's Greyhound bus terminal and service garage (HED 2008:22). Other major commissions included the Detroit City-County Building, now known as the Coleman A. Young Municipal Center, the Army Finance Center at Ft. Benjamin Harrison near Indianapolis, Indiana, the State Department Building in Washington D.C., Hazel Park Recreation Building, the

Dearborn Civic Center, breweries for Schlitz and Anheuser-Busch, and collegiate architecture when they were named the chief architect for the University of Detroit (HED 2008:21-26).

Currently known as Harley Ellis Deveraux, the firm celebrated its centennial anniversary in 2008.

2.3.2 History of the Coolidge Terminal Facility

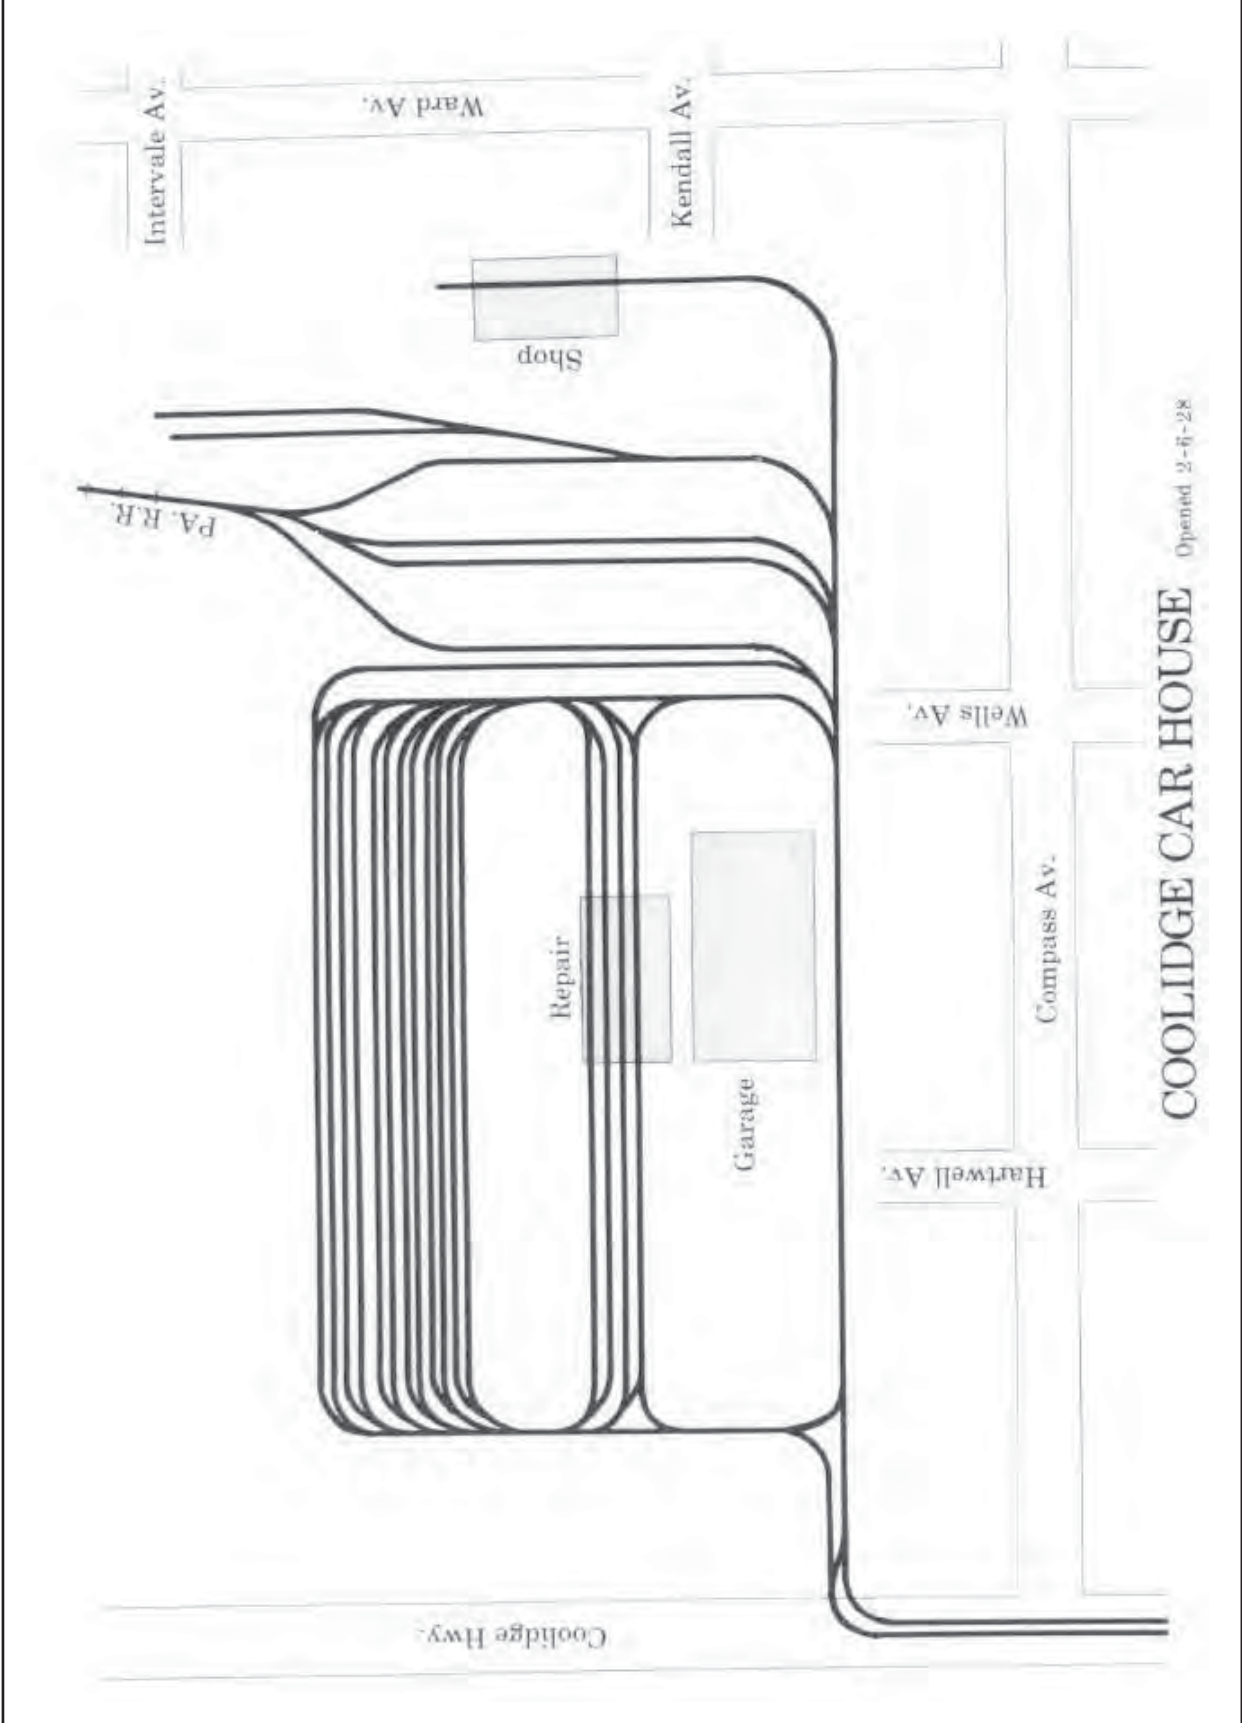

Between 1921 and 1926 a large portion of surrounding land was annexed to the northwest corner of the City of Detroit (Figure 2.3.2-1) (Detroit Planning Department 1985). More specifically, it was in 1924, that the city, trying to keep pace with the burgeoning need produced by the automotive industry and those who moved to the city to work in the shops, annexed the portion of Greenfield Township, Wayne County, where the Coolidge Terminal would later be constructed. The specific property associated with the terminal was listed in a real estate atlas in 1923 as a 20-acre parcel owned by M. Bryant (Bradley 2003:3-11). At the time Schaefer Highway was known as Monnier Road which boasted sparse industrial development, several plats for single-family homes, and the crossing of the Pennsylvania & Detroit Railway line (Baist 1923:59).

The Coolidge Terminal, located at 14044 Schaefer Highway, was constructed as a car house (trolley)/bus garage and opened on February 26, 1928. The Coolidge Terminal, located about midway on the Grand River Avenue route, was the third streetcar barn built under the city-owned municipal system, and DSR operation, but the first facility constructed by the City of Detroit to serve both trolley cars and buses, or as they were called at the time, coaches (Detroit Transit Facilities [DTF] 2012; Detroit Transit History [DTH] 2009). Between June 4, 1930 and August 11, 1937 the facility housed Trolley buses.

When first constructed, the facility had a rail line entering the property at the southeast corner, with parallel rail lines covering the west-central portion of the property. A second set of sidings running on a north/south axis occupied the eastern side of the property, providing a connection to the Pennsylvania & Detroit Railway which crossed Monnier Road about 560 feet (0.17 kilometers[km]) to the north. Additional rail lines carried cars through the repair shop. The property also boasted a garage and shop building (Figure 2.3.2-2) (Schramm et al. 1980:243).

In March 1938, an article described the new “streamlined” maintenance facility housed at the Coolidge Garage of the DSR (Figures 2.3.2-1 through 2.3.2-4) (*Bus Transportation* 1938:120). Extensive remodeling of the original facility enabled the DSR to quickly and efficiently service the 500 bus fleet with fuel, oil, and water. Intended for service only, the garage housed only badly disabled coaches (*Bus Transportation* 1938:121). Although the focus was on the new bus garage, the Coolidge Terminal continued to include street car service as is illustrated by the presence of the car house in Figure 2.3.2-2, and the numerous tracks located north of the garage.

Almost exactly 10 years after the garage was upgraded, on May 4, 1947, the car house was closed in preparation for reconstruction to the present complex (DTF 2009). The decision to

Figure 2.3.2-3. Coolidge Terminal in 1938

Source: DTH 200

Figure 2.3.2-4. Remodeled Interior of the Coolidge Terminal in 1938

reconstruct the facility was made about the same time that the DSR announced plans to abandon street car service in favor of passenger buses.

On April 26, 1946, the Detroit Common Council approved a contract between the DSR and the architecture engineering firm of Harley, Ellington, and Day, Inc. (City of Detroit [CD] 1946:1032). The contract specified that the firm would be responsible for the preparation of the final construction plans and letting of construction contracts for a garage required to store and service equipment. While this garage was not on the site of the Coolidge Terminal property, it did establish a relationship between the City of Detroit DSR and the firm of Harley, Ellington, and Day, Inc. In 1946, the firm designed the renovations to Detroit's Fort Street Union Rail Depot, and then went on to design six new garages for the DSR, which had been converting from streetcars to buses (HED 2008:22).

On May 4, 1947, Coolidge Car House closed (Schramm et al. 1980:270). On May 27, 1947, the City of Detroit's *Journal of the Common Council*, reported:

Please be advised that at the present time the Department of Street Railways is clearing its Coolidge coach terminal of old street cars, and preparing the site for the erection of a new storage garage. This necessitates the removal of some of our open storage car tracks on that site [CD 1947:1510].

The *Journal of the Common Council* recorded a report on June 13, 1947, by L. B. Smith, Purchase and Supplies, and approved by Richard A. Sullivan, General Manager. This report read in part:

In response to our advertisement for proposals for the construction of Coolidge Terminal at 14100 [sic] Schaefer Highway, bids were received and opened June 9, 1947...The lowest bid, in strict accordance with specifications, was submitted by the W.E. Wood Company and it is recommended that the contract be awarded to them on the basis of \$2,660,550.00 which includes alternate No. 3 for finishing wrought iron pipe instead of steel pipe [CD 1947:1624].

That September, Harley, Ellington and Day acquired a series of building permits for the buildings at Coolidge Terminal (Bradley 2003:3-12). The project completely rebuilt the facility and, other than the re-use of the steel frame from one of the original buildings, no evidence of the earlier car house remained. Constructed just months after the Gilbert Terminal, the two properties include a number of similarities, although the site plan differs due to the constrictions of an oddly shaped property for the Gilbert Terminal. The terminal buildings for the two properties are almost identical, with the plan simply mirrored at the Coolidge property (Bradley 2003:3-12). One other notable difference is the number of steel sash windows in the upper walls of the two bus maintenance buildings, with Coolidge boasting an additional row. For both

facilities, the designs featured concrete and steel building united by walls in blended shades of brick. While the new facilities are very different from the original terminal, the architect’s use of one-way bus lanes was surely inspired by the organization brought to the property by the original railroad lines.

Construction of the Coolidge Terminal, along with the new Gilbert Terminal and a large storage garage at the Shoemaker Terminal, were recorded at \$6 million in 1948 (Taylor 1948:67). This did not include any of the fees associated with the modernization of the fleets including the replacement of small buses and obsolete streetcars with larger modern buses. Construction of the new facilities also added items not needed for streetcars but imperative for buses. This included gasoline systems and modification of car pits for use on the bus motors (Taylor 1948:68).

The Coolidge Terminal Complex was constructed beginning in 1948 and ending in the late 1970s. The original buildings include the Bus Storage Building (1948-1950); the Bus Maintenance Building (1948) (Figure 2.3.2-5); the Bus Washing Building (1948); the Gate House (1948); the Terminal Building (1948) (Figure 2.3.2-6); the Fare Box House (1948); and the Heating Plant (1948 with a later undated addition). There is also a small building near Schaefer Highway, likely a Dispatch House, that was erected ca. 1960, but was abandoned prior to 2003. The final feature of the complex is the Communications Tower, erected post 1978 (Bradley 2003:3-7).

An article that ran in the industry magazine *Bus Transportation* in 1948 went into great detail regarding the construction of the Coolidge and Gilbert Terminals. In addition to a discussion of the location of each site, and how they were appropriately located near major roads that would eliminate the necessity to run “dead-head” or empty, the article discussed the components of each facility and the estimated cost of each structure (Taylor 1948:68). These figures are presented in Table 2.3.2-1.

Table 2.3.2-1. Estimated Cost of the Coolidge Terminal Buildings

Building Name	Cost
Storage Garage	1,020,000
Gas House	65,000
Gas Dispensing System	170,000
Power Plant	131,000
Maintenance and Service	658,900
Fare Box, Gate, Dispatch House, etc.	26,800
Terminal Building	199,800
Site Work (paving, drainage, fences, etc.)	389,000
Total Cost	\$2,660,500

Beginning in September 1950, there were 20 bus routes assigned to the Coolidge Terminal. These include:

Source: DTH 200

Figure 2.3.2-5. Coolidge Terminal Building 1 48

Source: DTH 200

Figure 2.3.2- . Coolidge Bus Maintenance Building 1 48

Broadstreet, Five Points, Grand River, Greenfield, Hamilton, Lahser, Livernois, Meyers, Northlawn, Plymouth-Caniff, Puritan-Fenkell, Schaefer, School, Schoolcraft, Six Mile Shuttle, Southfield, Second Avenue, Trumbull Railbus, West Chicago, and Wyoming [DTH 2012].

For five decades, the Coolidge Terminal continued to operate with only minor changes. In 1957 the bus washing area was expanded, and during the 1960s a small concrete-block building used as a dispatcher building was erected near the Schafer Highway boundary of the facility. At some point between 1948 and 1960 the Fare Box House was relocated and in the late 1970s the earlier radio tower was replaced with the current 480-foot structure.

On October 17, 2011, Michigan Senators Debbie Stabenow and Carl Levin announced support of five transportation projects across the state of Michigan that had been selected by the United States Department of Transportation (Levin and Stabenow 2011). Included in this package was a grant of \$518,291 to the D-DOT for the Coolidge Terminal and Garage Overhaul. Levin stated that the project, which was selected on a competitive basis through the Fiscal Year 2011 State of Good Repair Program, would fund the rehabilitation of a number of buildings at the Coolidge facility (Levin and Stabenow 2011).

In December 2011, before the work could be carried out on the facility, a fire damaged one of the buildings in the complex. Early in the morning of December 7, 2011, a two-alarm fire broke out in the Coolidge Terminal Bus Garage (Thomas 2011). This fire partially destroyed part of the bus garage, and destroyed a number of buses that had been stored inside. Reports the day after the fire noted that, “according to witnesses, the fire appeared to have started underneath one bus and appeared to have spread” (*Detroit Free Press* [DFP] 2011). When the fire was discovered, on-duty bus drivers, supervisors, and others on the scene were able to move about half the buses from the garage bay; however, eight buses were destroyed in the blaze. Many of the destroyed buses were new, valued at \$350,000 each (DPF 2011). In spite of the loss, D-DOT felt they would be able to continue to operate with no major delays when service resumed.

At the time of the field survey of the property in May 2012, only the Terminal Building is used for dispatch and other operational functions. No buses use the facility, and until the renovations are carried out, the property remains virtually empty.

3.0 COOLIDGE TERMINAL DESCRIPTION

Located in northwest Detroit, the terminal facility is situated on the east side of Schaefer Highway between major arterials of Schoolcraft Street and Fenkel Road. The facility occupies approximately 20 acres of land in the southwest quarter of Section 20, T1S/R11E, Wayne County, Michigan (Figure 3.0-1; see also Figure 1.1-1). The large area associated with the terminal is defined by a variety of fencing materials, securing the property from unauthorized entry. The main frontage, along Schaefer Highway, features a combination of chain-link fencing near the north and south corners of the property where vehicular access to the property was possible, and poured concrete barrier topped by a masonry block wall surmounted by a metal picket fence (Figure 3.0-2). The south and east sides of the property are divided from the surrounding neighborhood by tall concrete panel and post wall (Figure 3.0-3). The north side of the complex has a tall chain-link fence its entire length (Figure 3.0-4).

Stylistically, the Coolidge Terminal, and particularly the main office Terminal Building, is of the International style. These buildings feature flat roofs, usually without a ledge or coping at the roof line, typically metal casement type windows that are set flush with the outer walls, and smooth unornamented wall surfaces (McAlester and McAlester 1984:469). While the buildings tend to be unornamented, the façades are often asymmetrical, providing some visual interest to the property. This is certainly the case with the Coolidge Terminal office, which features one corner of the two-story building recessed from the front. The post-World War II construction enabled the use of aluminum, found on the window mullions and sashes as well as forming a wide molding element, doors, and interior hardware. As an alternative to the more expensive limestone, marble, or cast-stone, the architects utilized panels of light gray and red terrazzo on the façade. Additional light gray panels provide a sleek, smooth cladding material for the walls and free-standing column placed to support the outer corner of the recessed entry. Dark red spandrel panels placed between the windows and other fenestration elements read as voids in the wall when defined by the light color of the aluminum grid. Historically, the only ornament beyond the use and placement of different construction materials are the three large letters “D S R” positioned at the edge of the roof above the corner entrance (Bradley 2003:3-12). These letters were removed prior to the 2003 study of the property, although the precise date is not known.

There are eleven buildings, structures or objects associated with the Coolidge Terminal property (see Figure 3.0-1). Immediately north of the main access gate is the large Terminal Building currently used for administrative purposes. South of the Terminal Building and the operable gate, is the Gate House. South of the Gate House, along the east side of the front gate and situated near the center of the Bus Storage Building is the Dispatch House, that was no longer in use during the 2003 site review of the property by URS (Bradley 2003). The largest complex of buildings is the Bus Washing Building, Bus Maintenance Building, and Bus Storage Building. These three structures are each defined separately but share common walls. Together, this complex is clearly the largest on the property. North of the Bus Washing Building is the Fuel Station, and the Heating Plant is northeast. South of the Heating Plant is the Fare Box House and

Figure 3.0-4. Section of Chain-link Fence at Coolidge Terminal

Figure 3.0-5. Temporary Office Trailer East and South Elevations

a Temporary Office Trailer (Figure 3.0-5). South of the Fare Box House is the Communications Tower. There is a large area of open space on the east side of the property, once lined with railroad tracks for street car storage, and now simply open field for staff parking and open-air bus storage if needed. The final component of the Coolidge Terminal facility is the fueling area. Located near the north fence line east of the Terminal Building, the Fueling Station consists of a pump mounted on a low concrete platform (Figure 3.0-6). Remaining features of the complex are much more elaborate and are described in the following text.

3.1 TERMINAL BUILDING

In April 2012, this was the only building on the property still in use. Located north of the main gate, the Terminal Building was divided from the main storage and repair facilities by a driveway. In addition to providing a formal face to the property, the Terminal Building historically included a men's locker room for drivers, a break room, union offices, and bus pass sales operation on the first floor. The second floor housed the women's locker room, radio dispatch center, and administrative offices (Bradley 2003:3-9).

The two-story brick and gray terrazzo building has a rectangular plan and is oriented perpendicular to Schaefer Highway. The public entrance to the building is situated at the southwest corner of the building and is accented by the extensive use of limestone (Figure 3.1-1 through 3.1-3). The doors are recessed at the southwest corner of the building, yet highlighted by the use of light gray terrazzo panels on the surrounding walls and free-standing column at the open corner of the structure. Similar colored molding encircles the area with the terrazzo panels and wraps partially across the brick façade of the Terminal Building terminating just beyond a vertical bank of windows and spandrels near the recessed entry. The same molding extends partially down the length of the south elevation to a point at the east end of a vertical bank of windows on that elevation. The windows within this highlighted portion of the entry are divided by tall narrow rails into three bays under the recess and three on the main surface of the façade. As a result, the two-story building has six windows on the façade portion of the entry and three additional windows over three doors within the recessed area. Tall dark colored spandrels extend between the top of the first floor fenestration to the base of the second floor windows. Each individual window is further divided by metal sashes into four rows of two lights each.

Narrow bands of windows with stone sills pierce the façade wall marking the first and second stories. Similar bands of slightly larger windows are located at the first and second stories of the north and south elevation and only at the second story on the east elevation. These windows are all replacements, with modern black sashes and tinted glass. Only the four large window openings on the first story of the east elevation appear to retain most of their original windows. These east elevation windows have bars and indicate the location of the bus pass sales area where money was kept (Bradley 2003:3-9). Additional fenestration includes a metal door at the east corner of the south façade. This door provides access to a large open area and serves as the main door. The front entrance is not used.

Figure 3.0- . Fueling Station view northeast

Figure 3.1-1. Terminal building West and South Elevations

3.2 BUS STORAGE BUILDING

The largest and southernmost building at the Coolidge Terminal is the bus storage building (Figure 3.2-1 and 3.2-2). The one-story brick building is topped with a flat parapeted roof. The roof is supported by two different kinds of steel trusses. Most of the building has light-steel framing trusses popular during the mid-twentieth century for one-story industrial buildings.

The east corner of the south wall is taller than the remaining building. This section of the building features stone-capped pilasters regularly spaced along the wall dividing it into bays. Inside, Pratt trusses about 4 feet in height support the roof. The trusses are joined with reinforcing plates and diagonal horizontal braces to stabilize the bottom chords. It has been speculated that the presence of the pilasters and the Pratt trusses only in this portion of the building indicate that this is the surviving remnant of the 1928 Coolidge Terminal building, with the frame reused when it was reconstructed in 1948 (Bradley 2003:3-8).

Fenestration on the Bus Storage Building is limited to large overhead vehicle doors on the east and west elevations. These doors correspond with interior bus lanes which are divided on the interior into sections consisting of two or three lanes each and connected to each other by internal pedestrian doors. The interior walls are what saved the entire bus garage from destruction when a fire broke out in November 2011. Today the only evidence of the damage from the street is the fully blackened overhead door at the northeastern corner of the west elevation. Not visible from the road is the fact that the roof directly over this bus bay has also fallen in when the fire combined with the weight of a roof-top heating/cooling unit resulted in the trusses failing.

3.3 BUS MAINTENANCE BUILDING

Situated between the Bus Storage Building (to the north) and the Bus Washing Building (to the south), is the Bus Maintenance Building, the second largest structure on the property. The two major exposed elevations are on the east and west elevations of the structure, with the entire south wall shared with the adjacent storage building (Figure 3.3-1 and 3.3-2). The Bus Washing Building is smaller than the Bus Maintenance Building, resulting in a small section of the north elevation exposed at both the east and west ends. Two tiers of industrial metal sash windows fill most of the east and west elevations. The panels of the windows are held in place by wide steel mullions. Below the lower row of windows is a chest-high brick wall covered by sheet metal. The upper set of windows rise to just below the sheet-metal clad parapet coping. A narrow sheet-metal clad canopy extends from above the upper windows on the west elevation. Additional windows are set in the east and west ends of the north wall. These metal-sash windows are set in rectangular openings. A cast-stone continuous sill extends under the windows. A series of overhead doors on both the east and west elevations identify the vehicular bays. Inside, each of the vehicular bays is flanked by an angled service bay. Interior walls feature glazed tile blocks on the lower portion with the upper section consisting of concrete block.

Figure 3.2-1. Bus Storage Building West and South Elevations

Figure 3.2-2. Bus Storage Building East and South Elevations

Figure 3.3-1. Bus Maintenance Garage West and North Elevations

Figure 3.3-2. Bus Maintenance Garage East and North Elevations

3.4 BUS WASHING BUILDING

The Bus Washing Building is the northern-most component of the block of buildings that also includes the Bus Maintenance Building and the Bus Storage Building (Figure 3.4-1 and 3.4-2). Like most of the remaining complex the one-story L-plan building has brick-clad exterior walls and a flat roof. A large metal structure which held the materials needed for servicing the buses is situated near the north elevation of the building, which is also pierced by a pair of rectangular openings filled with metal sash windows. A metal pedestrian door is situated at the northwest corner of the building. There are six parallel bus washing bays, each identified by an overhead door on both the east and west elevations. Inside, the building walls are composed of glazed tile and glass block panels. The ell of the building is divided internally into a pair of locker rooms and equipment storage rooms that once served both the Bus Washing Building and the adjacent Bus Maintenance Building.

3.5 GATE HOUSE

Marking the entrance at Schaefer Road into the Coolidge Terminal property is the small Gate House (Figure 3.5-1). Located south of the Terminal Building, the Gate House is rectilinear in plan and oriented perpendicular to the main road. Constructed on a low concrete pad, the walls of the building are sheathed with brick. The brick walls rise only 12 courses and are topped by a cast-stone sill. Above the sill, the remainder of each wall is divided into bays by metal mullions and filled with either modern aluminum sash windows or a metal and glazed door at the center of the north elevation. The flat roof extends beyond the walls to form an overhang, although instead of following the shape of the Gate House, both corners on the east side of the building are clipped to prevent accidents when buses move in close proximity. Other protective measures include the erection of traffic bollards and metal railing across the east and south elevations.

3.6 HEATING PLANT

Currently the northeast building in the Coolidge Terminal Complex, the Heating Plant is made up of several structures constructed over time (Figure 3.6-1). The original building is located on the east side of the structure and consists of a large open area enclosed with brick walls and a flat roof. Large windows pierce the walls as clearstory windows on the south, east, and north elevations, while the windows are expanded on the west elevation to cover the upper two-thirds of the visible wall. A more recent concrete block and metal addition topped by a side gable metal clad roof covers a portion of the original west elevation. The walls of the addition are also pierced by a bank of metal sash windows high on the west elevation. Exposed metal tabs extend from the block walls suggesting that the original intention was to also clad this portion of the building with brick veneer. Extending from the south of the original heating plant is a one-story brick clad ell. The final portion of the structure is a cylindrical brick chimney stack encircled periodically by metal straps. The chimney stack tapers toward the top with a number of corbelled courses situated just below the top of the structure.

Figure 3.4-1. Bus Washing Building West and North Elevations

Figure 3.4-2. Bus Washing Building East and North Elevations

Figure 3.5-1. Gate House North and East Elevations

Figure 3. -1. Heating Plant North and East Elevations

3.7 FARE BOX HOUSE

Situated southwest of the Heating Plant, the Fare Box House is a rectangular plan building clad with sheet steel wall panels (Figure 3.7-1). The shed roof slopes down to the south, but extends beyond the walls of the building. The overhang is widest across the north elevation, where the majority of the fenestration is also located. A low concrete deck resting on a wider concrete pad extends across the north elevation and creates two steps to the level of the doors – accessible both from the grade level and at a height easy for drivers to exit their buses as well.

Fenestration includes three doors spaced on the north elevation: one at both the east and west corners and the third off-set from the middle toward the eastern door. Clerestory windows, covered with bars, are located across the façade as well as at the south corner of the east elevation. Additional windows extend down to form a second tier of three windows adjacent to both the west and center doors. Metal bars cover the windows and a metal grate door over the original door indicates that the building is essentially a building-sized safe (Bradley 2003:3-10).

3.8 COMMUNICATIONS TOWER

Located southeast of the Heating Plant, the Communications Tower consists of a tripod lattice antennae tower with three large guy wires extending out great distances at angles to assist in its support (Figures 3.8-1 and 3.8-2). The tower itself is situated inside a tall chain-link fence and flanked by several small buildings. The largest of the associated structures is simply constructed of concrete block which rises in a parapet above the almost flat roof.

3.9 DISPATCH HOUSE

Previously identified as “building no longer in use;” however, based on current project drawings, the building once served as the Dispatch House (see C-1, C-2, and C-3). The small concrete block building is rectilinear in plan and is oriented parallel to the nearby Schaefer Highway (Figure 3.9-1). Topping the structure is an almost flat roof that extends in a wide overhang on the east elevation. At the south end of the building there is an open side wall and another large opening in the south wall, presumably to permit adequate visibility for the building occupants. The north portion of the building forms a small office area featuring a large window with a fixed sash on the east elevation. A concrete ramp begins at the northeast corner of the Dispatch House and is partially encircled by a pipe railing. Like the nearby Guard House, heavy metal railings are situated near the north, south, and east elevations as protective measures for the building and its occupants.

4.0 EVALUATIONS AND RECOMMENDATIONS

4.1 PROJECT APE

Not including the Coolidge Terminal Complex, there are seven commercial buildings and a total of 24 residential structures in the APE for this project, all of which were constructed over 40 years ago (see Table 2.2-1). Of these, none demonstrate architectural or historical significance; therefore, CCRG recommends that none of the properties in the APE meet the requirements for inclusion in the NRHP.

4.2 COOLIDGE TERMINAL EVALUATION

4.2.1 Period of Significance

The Coolidge Terminal was established at the present site in 1928, just a short time after the City of Detroit had annexed the area from Greenfield Township. Operating initially as a shop and storage facility for the DSR's streetcars, particularly for those on the Grand River Avenue route, the facility was strategically placed to provide close access to the established routes. Other than the property itself and a tiny portion of one building that it is speculated came from an earlier time, there is no extant evidence of the history of the property between 1928 and 1947.

The current buildings of the Coolidge Terminal were constructed beginning in 1947, with the majority of the work completed by the end of 1948. The buildings from this time period are part of the modernization program the DSR launched following World War II, and represent one of last times that the City of Detroit developed a major transportation plan focused on public transportation rather than private automobiles; therefore, the period of significance for the Coolidge Terminal begins in 1947, with the beginning of construction on the site, and extends to 1962, a point 50 years ago and late enough to capture the time when the Dispatch House was constructed and the relocation of the Fare Box House. After 1962, there were only minor changes to the property, in spite of the financial difficulties and serious reduction in services over the following decades.

4.2.2 Integrity

The first step in determining if a property or district has historic significance and is associated with the determined period of significance is to examine its historic integrity. As previously stated, there are seven areas of integrity that are examined. These include: location, design, setting, materials, workmanship, feeling, or association.

The Coolidge Terminal property has not moved from its original site, and therefore retains integrity of setting. Additionally, the buildings surrounding the Terminal, or its setting, have also remained the same, or only undergone minor changes from the beginning of the period of significance in 1947 through the present day. The integrity of design, materials, and

workmanship are also very good. Alterations in these areas of integrity include the removal of the large DSR sign from the roofline of the Terminal Building; replacement of the windows in the Terminal Building, although in this case the openings remained the same and the replacement windows fitted into the original openings; removal of the small buildings once associated with the fueling area as well as several additional small buildings on the eastern portion of the property; and the construction of the unfinished addition to the Heating Plant. While the recent fire in the Bus Storage Building has impacted the materials and workmanship in this portion of the building, from the street, the damage appears to be limited to the blackened overhead door.

In spite of these changes, the character defining features of the Coolidge Terminal remain firmly in place. Post-World War II building materials and design principles include the use of concrete block for the structures then unified with the use of face brick, steel sash windows on each of the buildings, and the application of cost-saving terrazzo or porcelain enamel panels over stone panels. Even the use of aluminum marks the buildings as post-War given the scarcity of the material during the years of World War II.

With each of these aspects of integrity taken into consideration, it is clear that the Coolidge Terminal carries sufficient integrity to convey the functions and design program that resulted its construction as part of the DSR's modernization program.

4.2.3 NRHP Evaluation

Having established that the Coolidge Terminal has sufficient integrity the next step is to examine the potential NRHP Criteria of Evaluation and their application to the property. As previously noted, Criterion A requires that the property must be associated with events that have been significant in the broad patterns of our history. In the case of the Coolidge Terminal, this would be the association with transportation in Detroit. The Terminal Complex is representative of the public transportation in the city and the move of the DSR, in part through its modernization program, to implement the use of buses over streetcars. This was the last major move by the city to carry out planning, with public transportation the major area of concern. The rise of the private automobile, development of the extensive expressway system, and the associated cost factors of providing the service have since impacted planning efforts away from public transportation. Because the Coolidge Terminal is representative of the post-War planning for Detroit's mass transit, and its use of the sleek International style buildings to illustrate both the modernism program and the utilitarian/industrial aspects of the facility, it is considered eligible for inclusion in the NRHP under Criterion A.

Under NRHP Criterion B, the Coolidge Terminal must be associated with the lives of significant persons and their important contributions to history. While the association with the firm of Harley, Ellington and Day is undeniable, the Coolidge Terminal would likely not be considered their best or most important work; therefore, the property would not be eligible under Criterion B.

NRHP Criterion C requires the Coolidge Terminal to embody distinctive characteristics of bus terminal design, be a significant example of bus terminal design and/or construction, represent the work of a master architect, or exhibit high artistic values. Constructed from standard plans, the property does not have significance as an example of a bus terminal type property. As previously mentioned, while Harley, Ellington and Day were the architects, as a major firm working in the city, many of their projects carry greater architectural significance; therefore, CCRG does not recommend the property to be significant under NRHP Criterion C.

The Coolidge Terminal would not teach us anything about pre-history or history, and therefore is not recommended for listing under NRHP Criterion D.

4.3 RECOMMENDATIONS

The Coolidge Terminal is recommended eligible for inclusion in the NRHP under Criterion A as representative of the City of Detroit's move to modernize the public transportation system in the city during the post-World War II era.

Description

Located north of the main gate, the Terminal Building was divided from the main storage and repair facilities by a driveway. In addition to providing a formal face to the property, the Terminal Building historically included a men's locker room for drivers, a break room, union offices, and bus pass sales operation on the first floor. The second floor housed the women's locker room, radio dispatch center, and administrative offices (Bradley 2003:3-9).

The two story brick and gray terrazzo building has a rectangular plan and is oriented perpendicular to Schaefer Highway. The public entrance to the building is situated at the southwest corner of the building, and is accented by the extensive use of limestone. The doors are recessed at the southwest corner of the building, yet highlighted by the use of light-gray terrazzo panels on the surrounding walls and free-standing column at the open corner of the structure. Similar colored molding encircles the area with the terrazzo panels and wraps partially across the brick façade of the Terminal Building terminating just beyond a vertical bank of windows and spandrels near the recessed entry. The same molding extends partially down the length of the south elevation to a point at the east end of a vertical bank of windows on that elevation. The windows within this highlighted portion of the entry are divided by tall narrow rails into three bays under the recess and three on the main surface of the façade. As a result the two story building has six windows on the façade portion of the entry and three additional windows over three doors within the recessed area. Tall dark colored spandrels extend between the top of the first floor fenestration to the base of the second floor windows. Each individual window is further divided by metal sashes into four rows of two lights each.

Narrow bands of windows with stone sills pierce the façade wall marking the first and second story. Similar bands of slightly larger windows are located at the first and second story of the north and south elevation and only at the second story on the east elevation. These windows are all replacements, with modern black sashes and tinted glass. Only the four large window openings on the first story of the east elevation appear to retain the most of their original windows. These east elevation windows have bars and indicate the location of the bus pass sales area where money was kept (Bradley 2003:3-9). Additional fenestration includes a metal door at the east corner of the south façade. This door provides access to a large open area and serves as the main door. The front entrance is not used.

MH-6 B(5/93)

Description

The largest and southernmost building at the Coolidge Terminal is the bus storage building. The one-story brick tall building is topped with a flat parapeted roof. The roof is supported by two different kinds of steel trusses. Most of the building has light-steel framing trusses popular during the mid-twentieth century for one-story industrial buildings.

The east corner of the south wall is taller than the remaining building. This section of the building features stone-capped pilasters regularly space along the wall dividing it into bays. Inside, Pratt trusses about four-feet in height support the roof. The trusses are joined with reinforcing plates and diagonal horizontal braces to stabilize the bottom chords. It has been speculated that the presence of the pilasters and the Pratt trusses only in this portion of the building, indicate that this is the surviving remnant of the 1928 Coolidge Terminal building, with the frame reused when it was reconstructed in 1948 (Bradley 2003:3-8).

Fenestration on the bus storage building is limited to large overhead vehicle doors on the east and west elevations. These doors correspond with interior bus lanes which are divided on the interior into sections consisting of two or three lanes each and connected to each other by internal pedestrian doors. The interior walls are what saved the entire bus garage from destruction when a fire broke out in November 2011. Today the only evidence of the damage from the street is the fully blackened overhead door at the northeastern corner of the west elevation. Not visible from the road is the fact that the roof directly over this bus bay has also fallen in when the fire combined with the weight of a roof-top heating/cooling unit resulted in the trusses failing.

MH-6 B(5/93)

Description

Situated between the bus storage building (to the north) and the bus washing building (to the south), is the Bus Maintenance Building, the second largest structure on the property. The two major exposed elevations are on the east and west elevations of the structure, with the entire south wall shared with the adjacent storage building. The bus washing building is smaller than the Bus Maintenance Building, resulting in a small section of the north elevation exposed at both the east and west ends. Two tiers of industrial metal sash windows fill most of the east and west elevations. The panels of the windows are held in place by wide steel mullions. Below the lower row of windows is a chest-high brick wall covered by sheet metal. The upper set of window rises to just below the sheet-metal clad parapet coping. A narrow sheet-metal clad canopy extends from above the upper windows on the west elevation. Additional windows are set in the east and west ends of the north wall. These metal-sash windows are set in rectangular openings. A cast-stone continues sill extends under the windows. A series of overhead doors on both the east and west elevations identify the vehicular bays. Inside, each of the vehicular bays is flanked by an angled service bays. Interior walls feature glazed tile blocks on the lower portion with the upper section consisting on concrete block.

Description

The Bus Washing Building is the northern most component of the block of buildings that also includes the bus maintenance garage and the bus storage building. Like most of the remaining complex the one-story L-plan building has brick clad exterior walls and a flat roof. A large metal structure which held the materials needed for servicing the buses is situated near the north elevation of the building, which is also pierced by a pair of rectangular openings filled with metal sash windows. A metal pedestrian door is situated at the northwest corner of the building. There are six parallel bus washing bays, each identified by an overhead door on both the east and west elevations. Inside, the building walls are comprised of glazed tile and glass block panels. The ell of the building is divided internally into a pair of locker rooms, and equipment storage rooms that once served both the Bus Washing Building and the adjacent Bus Maintenance Building.

Description

Marking the entrance at Schaefer Road into the Coolidge Terminal property is the small Gate House. Located south of the terminal building, the Gate House is rectilinear in plan and oriented perpendicular to the main road. Constructed on a low concrete pad, the walls of the building are sheathed with brick. The brick walls rise only 12 courses and is topped by a cast-stone sill. Above the sill, the remainder of each wall is divided into bays by metal mullions and filled with either modern aluminum sash windows or a metal and glazed door at the center of the north elevation. The flat roof extends beyond the walls to form an overhang, although instead of following the shape of the Gate House, both corners on the east side of the building are clipped to prevent accidents when buses move in close proximity. Other protective measures include the erection of traffic bollards and metal railing across the east and south elevations.

Description

Currently the northeast building in the Coolidge Terminal complex, the Heating Plant is made up of several structures constructed over time. The original building is located on the east side of the structure and consists of a large open area enclosed with brick walls and a flat roof. Large windows pierce the walls as clearstory windows on the south, east, and north elevations, while the windows are expanded on the west elevation to cover the upper two-thirds of the visible wall. A more recent concrete block and metal addition topped by a side gable metal clad roof covers a portion of the original west elevation. The walls of the addition are also pierced by a bank of metal sash windows high on the west elevation. Exposed metal tabs extend from the block walls suggesting that the original intention was to also clad this portion of the building with brick veneer. Extending from the south of the original heating plant is a one-story brick clad ell. The final portion of the structure is a cylindrical brick chimney stack encircled periodically by metal straps. The chimney stack tapers toward the top with a number of corbelled courses situated just below the top of the structure.

Description

Previously identified as "building no longer in use", however, based on current project drawings, the building once served as the Dispatch House. The small concrete block building is rectilinear in plan and is oriented parallel to the nearby Schaefer Highway. Topping the structure is an almost flat roof that extends in a wide overhang on the east elevation. At the south end of the building there is an open side wall and another large opening in the south wall, presumably to permit adequate visibility for the building occupants. The north portion of the building forms a small office area featuring a large window with a fixed sash on the east elevation. A concrete ramp begins at the northeast corner of the dispatch house and is partially encircled by a pipe railing. Like the nearby Guard House, heavy metal railings are situated near the north, south, and east elevations as protective measures for the building and its occupants.

Description

One and one-half story bungalow is square in plan and rests on a rock-faced concrete block foundation. Exterior walls are clad with vinyl siding and the side gabled roof has a shed roofed dormer that extends over the full-width front porch. Brick piers topped by wrought-iron posts support the overhanging porch roof. On either side of the centered main entrance are wide window openings filled with grouped three-over-one double-hung sash windows. The remaining windows appear to have similar double-hung and single fixed-light sashes.

Significance

Date of Construction 1926

Description

The one and one-half story gable front bungalow has a concrete block foundation, clapboard exterior walls and an asphalt shingle clad roof. The roof features broad overhangs and three large knee brackets in the gable end. A brick chimney extends above the west roof slope. The house has a full-width front porch topped by a hipped roof which is, in turn, supported by four wood posts and surrounded by a tall balustrade. Most windows have been replaced with horizontal sliders, although a pair of original windows, with four vertical lights each, is present in the gable peak.

Significance

Description

The building complex consists of two structures. The oldest, a metal Quonset Hut, is situated on the west side of the property and almost completely obscured by trees, a pile of dirt, and the second building.

The second structure on the lot is a two-story building with a concrete block foundation and main floor that appears to connect to the Quonset Hut, but is expanded with a projecting ell near the center of the structure. This structure is unfinished, with the second floor currently consisting of plywood and only one visible point of entry near the center of façade. Glass blocks comprise the windows in the main part of the first floor with a metal door placed on the south and east elevation of the ell.

Significance

Date of Construction 1946

Architect/Builder _____

Context(s): _____

In 1946, City of Detroit Journal of the Common Council records indicates that a petition was approved by Marsden E. Bowers to convert an existing easement to an alley accessing 13200 Intervale (City of Detroit 1947:488).

Description

The property includes a warehouse building constructed in 1945 and enlarged with a retail wing in the 1960s (Bradley 2003). Both parts of the building complex feature flat roofs. The retail portion of the complex has stone ashlar veneer on three piers that divide the façade into two unequal halves. Original windows and doors on this portion of the complex have been in-filled with concrete block. A wood shingled false mansard roof extends along the upper portion of the south, east, and north elevations of the wing. The associated warehouse building, situated west of the retail wing, has concrete block exterior walls.

Significance

Date of Construction 1945

Architect/Builder

Context(s):

Records indicate that in 1945 a building was constructed on the property. By the mid-1950s, the property was under the ownership of the Sherwood Lumber Company (Bradley 2003). In the 1960s, the front portion of the building

Description

Set well back from Schaefer Highway, the building is a two-story structure which historically functioned as an office and stock building. Constructed of concrete block, the façade features a brick veneer which rises up in a stepped parapet hiding the low-pitched hipped roof beyond. Originally a string of windows stretched across the façade high above the doorways, but this has been partially in-filled, leaving seven individual horizontal windows to fill the space between vertical panels. A large grade-level opening has also been in-filled with glass block and a centrally placed window enclosed with brick. The remaining door is located near the southeast corner of the façade.

Significance

Date of Construction 1923
Architect/Builder
Context(s):

This property was the first to be developed on the west side of Schaefer Highway near the Coolidge Terminal site. The original business on the property was the Peck Asphalt Shingle Company, later known as the Dawson Roofing Company (Bradley 2003). In 1940, the company was listed under the names of Flintkote Company and Beckman-Dawson Roofing Company. Spurs from the nearby railway entered the property and flanked the main building

MH-6 B(5/93)

Description

An example of the Art Moderne style, the building appears to have very few alterations since it was originally constructed. The one-story brick building features parapets to hide the flat roof. Stone is applied in a band encasing the front windows, forms four piers at the center entry of the façade, and clads a sign panel placed perpendicular to Schaefer Highway above the center entry. The sign panel has the words:

O. H. Frisbee
Storage
Moving

in raised yellow lettering over the front door. Windows are one-over-one double-hung aluminum sashes divided by stone across the width of the façade, and evenly spaced down the side elevations of the office portion of the building. Windows on the side elevations are visually tied to the façade by the use of stone sills. The rear of the building consists of concrete block exterior walls, with regularly spaced loading bays below a projecting roof accessing the eight different storage areas within.

Significance

Date of Construction 1945

Architect/Builder _____

Context(s): _____

Constructed in 1945 as an income producing facility by O. H. Frisbie, the building provided both office and warehouse facilities for a number of smaller firms. In 1956 there were ten occupants in the building, including several manufacturer's agents, building materials firms, and a chemical company. The main office for Frisbie Moving and Storage was on Grand River initially, but with the construction of I-96 he was forced to relocate to this site (Bradley 2003).

MH-6 B(5/93)

Description

This property includes two large warehouses, each pierced by a series of loading docks. The west building, closest to Schaefer Highway, has a grey brick façade and concrete block exterior walls on the remaining structure. The earlier east building is entirely concrete block, but consists of a lower section on the west end and two-story building beyond.

Significance

Date of Construction 1970 (front) /1967(rear)

Architect/Builder

Context(s):

Constructed as expanded facilities for O.H. Frisbie Moving and Storage located on the west side of Schaefer Highway (Bradley 2003).

Description

The one-story rectangular plan residence rests on a concrete block foundation and has brick veneered façade. Corrugated metal clads the remaining exterior walls. The front gable roof orients the house perpendicular to the main road. A half-width metal awning supported by wrought iron posts defines the small front porch. The large windows flanking the front entry are double-hung with eight-over-twelve sashes. Remaining windows on the building are horizontal sliders.

Significance

Date of Construction 1970
Architect/Builder _____
Context(s): _____

This house was one of several in-fill dwellings constructed in the neighborhood (Bradley 2003).

Description

The one-story house rests on a concrete block foundation, has synthetic siding on the façade and Masonite siding on the remaining building. The gable front roof is clad with asphalt shingles. A shallow pent roof extends from the roof/wall junction at the northwest corner of the house, over the front entry, and ends above a large window placed near the center of the façade. Remaining windows are set high on the wall and are either awning sashes or horizontal sliders.

Significance

Date of Construction 1954

Architect/Builder _____

Context(s): _____

This house was one of several in-fill dwellings constructed in the neighborhood during a post-World War II building boom (Bradley 2003).

Description

The one and one-half story side gable bungalow is sheathed in Insulbrick siding, including on the lower wall of the open porch and the battered piers supporting the roof over the porch. A gable front dormer with a string of three small windows, is situated at the center of the east roof slope and is also clad with Insulbrick siding. The front entry is situated off-set from the center directly across from the front steps. A string of three windows completes the fenestration of the façade below the broken slope of the roof. Additional windows are placed either singly or in pairs, and are either double-hung with one-over-one sashes or fixed lights.

In addition to the main residence, the property includes a wood frame garage.

Significance

Date of Construction 1923

Architect/Builder _____

Context(s): _____

This house was erected during the first phase of development of the Greenlawn Subdivision (Bradley 2003).

Description

The one and one-half story Tudor Revival residence features a cross-gable roof and almost square footprint. The exterior walls of the house are clad with brick, including the low curved wing wall which extends from the northeast corner. The gable peak over the front façade has stucco with half-timbering while wood shakes are utilized in the remaining main roof peaks. A lower gable roof extends over the open front porch and features walls clad with brick and an exaggerated stone keystone over the arched front opening. The concrete porch deck extends to the north from the formal entry and is encircled by a low wrought iron railing. The main entry is located under the gable roofed section of the porch, with a string of three double-hung windows below the half-timbered peak. Additional windows include double-hung or fixed lights.

MH-6 B(5/93)

Description

The two-story Tudor Revival residence has an essentially square footprint, defined largely by the shallow-pitched hipped roof. A large stucco and half-timber steeply pitched peak rises from above the first story windows and pierces the roof line to form a wall dormer. A second lower gable peaked ell extends from the east elevation and includes the primary front entry. Like the lower portion of the house, the entry ell is sheathed with brick veneer. The second story of the house outside the front gable peak is clad with coursed wood shingles. The front door is topped by a stucco arch and a small vent is located in the gable peak. The double-hung windows with three-over-one sashes are placed in strings of three. Remaining windows have the same double-hung sash pattern, but are placed singly or in pairs.

Description

The one and one-half story Tudor Revival style residence has a square footprint topped by a cross gable roof. Each of the gable peaks, with the exception of the peak at the south elevation where the brick chimney stack is located, has clipped gables. This includes the lower gable peaked wall dormer over the front entry, which is further emphasized by the wide raking cornice that extends down to a few feet above the concrete porch deck. The house has a red brick veneer accented by random dark colored clinker bricks. An open porch extends across the width of the house, defined by an aluminum awning supported by wrought iron posts. A small arched window is located near the peak of the taller cross gable element which also features a horizontal slider window at the first floor level.

Description

The one and one-half story Tudor Revival style house has a square footprint and is topped by a cross-gabled roof. Most of the house is sheathed with brick with the exceptions of the gable peaks and small areas of coursed stone at the terminus of the raking cornice the facade. Gables on the north and south elevations are clad with wood shingles while the two gable peaks on the façade feature stucco and half-timbering in their peaks. A pair of brick walls flanks the concrete stairs which access the front door situated in the smaller of the two front gables. Brick piers flank the front entry and are capped by gable peaks adding substance to the otherwise utilitarian doorway. The second gable peak is pierced by a single light window. The wall below the gable features a pair of double-hung one-over-one windows with a cast-stone sill.

Re: Project Review Request for Proposed Improvements and New Construction at the Coolidge Terminal Facility, Detroit, Wayne County, Michigan

Dear Mr. Westlake:

On behalf of the Detroit Department of Transportation (DDOT), URS Corporation is submitting information on the proposed Coolidge Terminal project for your review. URS has been retained by DDOT to prepare information for a federal Categorical Exclusion for the proposed project. At your earliest convenience, we would appreciate your agency's comments and any available information on resources under your agency's purview, to complement our efforts during this phase of work.

The Detroit Department of Transportation (DDOT) is proposing a construction project at its Coolidge Terminal Facility located at 14044 Schaefer Highway in the City of Detroit. The Coolidge Facility is one of four facilities that DDOT owns and operates to service its bus fleet. DDOT is seeking Federal Transit Administration (FTA) funding assistance and is therefore subject to compliance with the National Environmental Policy Act (NEPA) of 1969, as amended. Exhibits including a project location map (Figure 1) and site map (Figure 2) are attached.

Existing Site Description

The Coolidge Facility consists of several buildings concentrated on the western portion of an approximately 20-acre site. A guard/gate house, terminal (administration) building, and a small building no longer in use stand close to Schaefer Highway. A large complex of connected bus storage, maintenance, and washing buildings occupies the south-central portion of the site and is surrounded by paved areas. A fare box house and a heating plant are located northeast of the complex of buildings. A communications tower and adjacent equipment buildings stand on the eastern portion of the site, which is an unpaved area used for bus parking. On the eastern portion of the site, vegetation consisting of turf grass, brush/shrubs, and deciduous trees exists along the perimeter.

The Coolidge Facility operates 24 hours per day, 7 days per week. Estimated total vehicle activity at the facility during a typical weekday is approximately 1,500 generated by approximately 430 staff arrivals/departures and approximately 330 bus pull-outs/pull-ins.

The area immediately adjacent to the Coolidge Facility is dominated by Industrial, Commercial/Office and Transportation land uses to the north and west. South and east of the site, land uses are comprised of residential areas and vacant land.

Project Description

The Coolidge Facility construction project proposes to modernize and improve existing DDOT equipment, buildings and property, as well as new construction. The proposed project would be contained at the site and upon completion would result in the facility returning to its normal operations. Proposed construction would not result in any additional taking of land; therefore, no acquisitions or relocations are required. The proposed project is a renovation of existing equipment and infrastructure and the construction of new facilities on site.

The proposed project includes interior work on the existing buildings, repair and/or replacement of roofs on existing buildings, demolition and removal of the existing fare box building and the existing boiler/power house, and the construction of a new fare box building and the addition of an approximately 100,000-square-foot bus storage building on the eastern portion of the parcel. Other improvements would include fueling system upgrades, new concrete pavement and curbs, new guardrail system, upgrading locker rooms, rehabilitation of the terminal (administration) building, replacement of existing perimeter fencing, a new security system, interior painting and lighting upgrades, new primary electrical service and a new emergency generator system. Approximately one acre of vegetation would be removed including approximately 11 trees ranging in diameter from 4 to 15 inches. Upon completion of the proposed project, the Coolidge Facility would resume its normal operations. Vehicle activity at the site is not expected to increase in the near future.

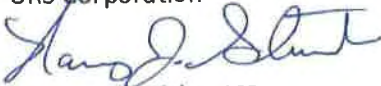

Potential Adverse Impacts

Since the proposed project would be contained at the site, few impacts are anticipated. Short-term adverse impacts would occur during the construction of the proposed project and may include localized traffic and utility impacts, as well as noise, vibration and air quality impacts. Impacts to soils and vegetation may create a short-term impact to water quality from storm water run-off. Potential long-term impacts may include adverse effects to historic resources on site.

If you have any questions or need additional information to formulate your agency's response, please contact me at (612) 373-6363 or nancy.stavish@urs.com. Thank you for your assistance with this project.

Sincerely,

URS Corporation

Hi Nancy,

EPA gave the provided materials a cursory review and decided not to provide comments.

Thank you for checking in.

Regards,
Elizabeth

Phone: 312-353-2087

Please note that starting October 1, 2012, EPA will not accept paper copies or CDs of EISs for filing purposes; all submissions on or after October 1, 2012 must be made through new electronic EIS submittal tool: *e-NEPA*. While this system eliminates the need to submit paper or CD copies to EPA to meet filing requirements, electronic submission does not change requirements for distribution of EISs for public review and comment, including distribution of EISs to EPA Regional Offices for review. To begin using *e-NEPA*, you must first register with EPA's electronic reporting site - https://cdx.epa.gov/epa_home.asp

Hello Elizabeth,

I am writing to inquire about the status of the anticipated EPA response letter.

If a response letter has been prepared and sent to FTA, may I request a copy.

If the response letter is still forthcoming, could you provide the timeframe for when it might be sent?

Have a nice weekend.
Nancy

Re: Project Review Request for Proposed Improvements and New Construction at the Coolidge Terminal Facility, Detroit, Wayne County, Michigan

Dear Sir or Madam:

On behalf of the Detroit Department of Transportation (DDOT), URS Corporation is submitting information on the proposed Coolidge Terminal project for your review. URS has been retained by DDOT to prepare information for a federal Categorical Exclusion for the proposed project. At your earliest convenience, we would appreciate your agency's input regarding potential impacts related to resources under your agency's purview and permit and mitigation requirements to complement our efforts during this phase of work.

The Detroit Department of Transportation (DDOT) is proposing a construction project at its Coolidge Terminal Facility located at 14044 Schaefer Highway in the City of Detroit. The Coolidge Facility is one of four facilities that DDOT owns and operates to service its bus fleet. DDOT is seeking Federal Transit Administration (FTA) funding assistance and is therefore subject to compliance with the National Environmental Policy Act (NEPA) of 1969, as amended. Exhibits including a project location map (Figure 1) and site map (Figure 2) are attached.

Existing Site Description

The Coolidge Facility consists of several buildings concentrated on the western portion of an approximately 20-acre site. A guard/gate house, terminal (administration) building, and a small building no longer in use stand close to Schaefer Highway. A large complex of connected bus storage, maintenance, and washing buildings occupies the south-central portion of the site and is surrounded by paved areas. A fare box house and a heating plant are located northeast of the complex of buildings. A communications tower and adjacent equipment buildings stand on the eastern portion of the site, which is an unpaved area used for bus parking. On the eastern portion of the site, vegetation consisting of turf grass, brush/shrubs, and deciduous trees exists along the perimeter.

The Coolidge Facility operates 24 hours per day, 7 days per week. Estimated total vehicle activity at the facility during a typical weekday is approximately 1,500 generated by approximately 430 staff arrivals/departures and approximately 330 bus pull-outs/pull-ins.

The area immediately adjacent to the Coolidge Facility is dominated by Industrial, Commercial/Office and Transportation land uses to the north and west. South and east of the site, land uses are comprised of residential areas and vacant land.

Project Description

The Coolidge Facility construction project proposes to modernize and improve existing DDOT equipment, buildings and property, as well as new construction. The proposed project would be contained at the site and upon completion would result in the facility returning to its normal operations. Proposed construction would not result in any additional taking of land; therefore, no acquisitions or relocations are required. The proposed project is a renovation of existing equipment and infrastructure and the construction of new facilities on site.

The proposed project includes interior work on the existing buildings, repair and/or replacement of roofs on existing buildings, demolition and removal of the existing fare box building and the existing boiler/power house, and the construction of a new fare box building and the addition of an approximately 100,000-square-foot bus storage building on the eastern portion of the parcel. Other improvements would include fueling system upgrades, new concrete pavement and curbs, new guardrail system, upgrading locker rooms, rehabilitation of the terminal (administration) building, replacement of existing perimeter fencing, a new security system, interior painting and lighting upgrades, new primary electrical service and a new emergency generator system. Approximately one acre of vegetation would be removed including approximately 11 trees ranging in diameter from 4 to 15 inches. Upon completion of the proposed project, the Coolidge Facility would resume its normal operations. Vehicle activity at the site is not expected to increase in the near future.

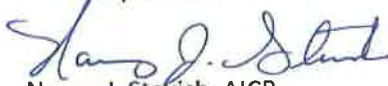

Potential Adverse Impacts

Since the proposed project would be contained at the site, few impacts are anticipated. Short-term adverse impacts would occur during the construction of the proposed project and may include localized traffic and utility impacts, as well as noise, vibration and air quality impacts. Impacts to soils and vegetation may create a short-term impact to water quality from storm water run-off. Potential long-term impacts may include adverse effects to historic resources on site.

If you have any questions or need additional information to formulate your agency's response, please contact me at (612) 373-6363 or nancy.stavish@urs.com. Thank you for your assistance with this project.

Sincerely,

URS Corporation

Re: Project Review Request for Proposed Improvements and New Construction at the Coolidge Terminal Facility, Detroit, Wayne County, Michigan

Dear Mr. Scott:

On behalf of the Detroit Department of Transportation (DDOT), URS Corporation is submitting information on the proposed Coolidge Terminal project for your review. URS has been retained by DDOT to prepare information for a federal Categorical Exclusion for the proposed project. At your earliest convenience, we would appreciate your department's comments and any available information on resources under your agency's purview to complement our efforts during this phase of work.

The Detroit Department of Transportation (DDOT) is proposing a construction project at its Coolidge Terminal Facility located at 14044 Schaefer Highway in the City of Detroit. The Coolidge Facility is one of four facilities that DDOT owns and operates to service its bus fleet. DDOT is seeking Federal Transit Administration (FTA) funding assistance and is therefore subject to compliance with the National Environmental Policy Act (NEPA) of 1969, as amended. Exhibits including a project location map (Figure 1) and site map (Figure 2) are attached.

Existing Site Description

The Coolidge Facility consists of several buildings concentrated on the western portion of an approximately 20-acre site. A guard/gate house, terminal (administration) building, and a small building no longer in use stand close to Schaefer Highway. A large complex of connected bus storage, maintenance, and washing buildings occupies the south-central portion of the site and is surrounded by paved areas. A fare box house and a heating plant are located northeast of the complex of buildings. A communications tower and adjacent equipment buildings stand on the eastern portion of the site, which is an unpaved area used for bus parking. On the eastern portion of the site, vegetation consisting of turf grass, brush/shrubs, and deciduous trees exists along the perimeter.

The Coolidge Facility operates 24 hours per day, 7 days per week. Estimated total vehicle activity at the facility during a typical weekday is approximately 1,500 generated by approximately 430 staff arrivals/departures and approximately 330 bus pull-outs/pull-ins.

The area immediately adjacent to the Coolidge Facility is dominated by Industrial, Commercial/Office and Transportation land uses to the north and west. South and east of the site, land uses are comprised of residential areas and vacant land.

Project Description

The Coolidge Facility construction project proposes to modernize and improve existing DDOT equipment, buildings and property, as well as new construction. The proposed project would be contained at the site and upon completion would result in the facility returning to its normal operations. Proposed construction would not result in any additional taking of land; therefore, no acquisitions or relocations are required. The proposed project is a renovation of existing equipment and infrastructure and the construction of new facilities on site.

The proposed project includes interior work on the existing buildings, repair and/or replacement of roofs on existing buildings, demolition and removal of the existing fare box building and the existing boiler/power house, and the construction of a new fare box building and the addition of an approximately 100,000-square-foot bus storage building on the eastern portion of the parcel. Re: Rare Species Review Request for Proposed Improvements and New Construction at the Coolidge Terminal Facility, Detroit, Wayne County, Michigan
T1S R11E Section 20

Dear Sir or Madam:

On behalf of the Detroit Department of Transportation (DDOT), URS Corporation is submitting information on the proposed Coolidge Terminal project for your review and formally requests a Rare Species Review based on viable records in the Natural Heritage Database that are located within a mile and a half of the project site.

The Detroit Department of Transportation (DDOT) is proposing a construction project at its Coolidge Terminal Facility located at 14044 Schaefer Highway in the City of Detroit. The Coolidge Facility is one of four facilities that DDOT owns and operates to service its bus fleet. DDOT is seeking Federal Transit Administration (FTA) funding assistance and is therefore subject to compliance with the National Environmental Policy Act (NEPA) of 1969, as amended. Exhibits including a project location map (Figure 1) and site map (Figure 2) are attached.

URS has been retained by DDOT to prepare information for a federal Categorical Exclusion for the proposed project. URS requests that your agency review the proposed project and provide information about federal and state endangered, threatened, and rare species, high quality natural communities, and significant natural areas within the project area. Any information provided will be used for further project development and will be included in the documented Categorical Exclusion. All stipulations and requirements for using this data, as prescribed by the Michigan Natural Features Inventory, will be followed.

Existing Site Description

The Coolidge Facility consists of several buildings concentrated on the western portion of an approximately 20-acre site. A guard/gate house, terminal (administration) building, and a small building no longer in use stand close to Schaefer Highway. A large complex of connected bus storage, maintenance, and washing buildings occupies the south-central portion of the site and is surrounded by paved areas. A fare box house and a heating plant are located northeast of the complex of buildings. A communications tower and adjacent equipment buildings stand on the eastern portion of the site, which is an unpaved area used for bus parking. On the eastern portion of the site, vegetation consisting of turf grass, brush/shrubs, and deciduous trees exists along the perimeter.

The Coolidge Facility operates 24 hours per day, 7 days per week. Estimated total vehicle activity at the facility during a typical weekday is approximately 1,500 generated by approximately 430 staff arrivals/departures and approximately 330 bus pull-outs/pull-ins.

The area immediately adjacent to the Coolidge Facility is dominated by Industrial, Commercial/Office and Transportation land uses to the north and west. South and east of the site, land uses are comprised of residential areas and vacant land.

Project Description

The Coolidge Facility construction project proposes to modernize and improve existing DDOT equipment, buildings and property, as well as new construction. The proposed project would be contained at the site and upon completion would result in the facility returning to its normal operations. Proposed construction would not result in any additional taking of land; therefore, no acquisitions or relocations are required. The proposed project is a renovation of existing equipment and infrastructure and the construction of new facilities on site.

The proposed project includes interior work on the existing buildings, repair and/or replacement of roofs on existing buildings, demolition and removal of the existing fare box building and the existing boiler/power house, and the construction of a new fare box building and the addition of an approximately 100,000-square-foot bus storage building on the eastern portion of the parcel. Other improvements would include fueling system upgrades, new concrete pavement and curbs, new guardrail system, upgrading locker rooms, rehabilitation of the terminal (administration) building, replacement of existing perimeter fencing, a new security system, interior painting and lighting upgrades, new primary electrical service and a new emergency generator system. Approximately one acre of vegetation would be removed including approximately 11 trees ranging in diameter from 4 to 15 inches. Upon completion of the proposed project, the Coolidge Facility would resume its normal operations. Vehicle activity at the site is not expected to increase in the near future.

Potential Adverse Impacts

Since the proposed project would be contained at the site, few impacts are anticipated. Short-term adverse impacts would occur during the construction of the proposed project and may include localized traffic and utility impacts, as well as noise, vibration and air quality impacts. Impacts to soils and vegetation may create a short-term impact to water quality from storm water run-off. Potential long-term impacts may include adverse effects to historic resources on site.

If you have any questions or need additional information to formulate your agency's response, please contact me at (612) 373-6363 or nancy.stavish@urs.com. Thank you for your assistance with this project.

Sincerely,

URS Corporation

Re: Rare Species Review #1104 – Coolidge Terminal Facility, Detroit, MI

Dear Nancy:

The location for the proposed project was checked against known localities for rare species and unique natural features, which are recorded in the Michigan Natural Features Inventory (MNFI) natural heritage database. This continuously updated database is a comprehensive source of existing data on Michigan's endangered, threatened, or otherwise significant plant and animal species, natural plant communities, and other natural features. Records in the database indicate that a qualified observer has documented the presence of special natural features. The absence of records in the database for a particular site may mean that the site has not been surveyed. The only way to obtain a definitive statement on the status of natural features is to have a competent biologist perform a complete field survey.

Under Act 451 of 1994, the Natural Resources and Environmental Protection Act, Part 365, Endangered Species Protection, "a person shall not take, possess, transport, ...fish, plants, and wildlife indigenous to the state and determined to be endangered or threatened," unless first receiving an Endangered Species Permit from the Michigan Department of Natural Resources (MDNR), Wildlife Division. Responsibility to protect endangered and threatened species is not limited to the lists below. Other species may be present that have not been recorded in the database.

According to the natural heritage database, it is **highly unlikely** that listed species will be impacted by this activity. However, MNFI cannot fully assess potential impacts without an on-site survey. Be mindful that MNFI is not a regulatory agency. MDNR Wildlife Division is responsible for issuing permits and enforcement relative to the take of endangered and threatened species. These data can be submitted to the Wildlife Division should it be determined this project requires an endangered species permit. Their contact person is Lori Sargent, MDNR Wildlife Division, P.O. Box 30180, Lansing, MI 48909. Phone: 517.373.1263, email: SargentL@michigan.gov. Should MDNR require more information regarding your project, MNFI offers more detailed reviews including field surveys which I would be happy to discuss with you.

Sincerely,

Michael Sanders
Environmental Review Specialist/Zoologist

*Special concern species and natural communities are not protected under endangered species legislation but efforts should be made to minimize any or all impacts.

Codes to accompany Table 1:

State Protection Status Code Definitions (SPROT)

E: Endangered

T: Threatened

SC: Special concern

Global Heritage Status Rank Definitions (GRANK)

The priority assigned by NatureServe's national office for data collection and protection based upon the element's status throughout its entire world-wide range. Criteria not based only on number of occurrences; other critical factors also apply. Note that ranks are frequently combined.

G1 = critically imperiled globally because of extreme rarity (5 or fewer occurrences range-wide or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extinction.

G2 = imperiled globally because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extinction throughout its range.

G3: Either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range (e.g. a single western state, a physiographic region in the East) or because of other factor(s) making it vulnerable to extinction throughout its range; in terms of occurrences, in the range of 21 to 100.

G4: Apparently secure globally, though it may be quite rare in parts of its range, especially at the periphery.

G5: Demonstrably secure globally, though it may be quite rare in parts of its range, especially at the periphery.

Q: Taxonomy uncertain

State Heritage Status Rank Definitions (SRANK)

The priority assigned by the Michigan Natural Features Inventory for data collection and protection based upon the element's status within the state. Criteria not based only on number of occurrences; other critical factors also apply. Note that ranks are frequently combined.

S1: Critically imperiled in the state because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extirpation in the state.

S2: Imperiled in state because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extirpation from the state.

S3: Rare or uncommon in state (on the order of 21 to 100 occurrences).

S4 = apparently secure in state, with many occurrences.

S5 = demonstrably secure in state and essentially ineradicable under present conditions.

SX = apparently extirpated from state.

DDOT-Coolidge Replacement Bus Terminal and HR&O

Preliminary Space Needs Program - Concept Design Estimate

April 27, 2017

Owner
Detroit Department of Transportation

Cost Estimator:

75 Arlington Street
Boston, MA 02116
(617) 426 7330

SUMMARY

Under the direction of the Detroit Department of Transportation (DDOT) a preliminary investigation of function and cost implications was undertaken for the phased consolidation, upgrade and redevelopment of their bus maintenance facilities at Coolidge Terminal, Main Garage at 1301 East Warren Avenue, Gilbert and Shoemaker Terminal (s). The plan consolidated operations and maintenance from these four facilities into two; Coolidge and Shoemaker facilities in three phases. In Phase 1, the Coolidge facility would be re-built to independently accommodate the maintenance and storage of 200 buses and eliminate the need for the aging Gilbert facility. In Phase 2, the Shoemaker facility would be modified to eliminate its reliance on heavy maintenance functions that are being performed at the Main Garage on East Warren Street, thereby eliminating the need for that aging facility. Finally, the capacity for maintenance and storage at the Coolidge facility would be increased by 100 buses in Phase 3 to accommodate DDOT's ultimate design fleet size.

After developing an initial construction cost estimate for these three phases, it was determined that the estimate for Phase 1 was approximately 8% to 10% higher than the projected funding that could realistically be made available for this phase. Therefore, it was requested that alternatives be developed to reduce the estimated construction cost of Phase 1 by \$9M to \$10M, in a manner that least or not at all, compromised the ultimate maintenance operations plan for the system. Three options were developed to address this goal. These are described below followed by their respective financial cost savings.

OPTION A

This option externalizes bus circulation, stacking buses in the fully enclosed storage area / building and thereby reduces the square footage required for this function. All other items remain the same as previously shown in space needs program for a fleet of 200 buses. This reduction in building size would lower the cost to under \$90M by taking away the needed square footage to provide indoor circulation of buses between storage, fueling and washing as part of routine maintenance. This would require buses to circulate from interior bus parking to an exterior drive, back inside.

Pros:

1. All 200 buses stored inside.
2. If this condition is a long term acceptable practice it would reduce construction cost in Phase 3 as well.

Cons:

1. Daily servicing is inefficient as buses would be exposed to wet and cold weather between servicing and storage.
2. Increased operational costs.
3. If this condition is not a long term acceptable practice, it would need to be corrected in Phase 3, however optimization of maintenance operations in later phases would be more complicated as some selective demolition and reconfiguration would be needed to allow interior circulation.

OPTION B

This option would lower the size of fleet to be maintained in Phase 1, from 200 buses to 180 buses and would translate to smaller Phase 1 square footage requirements in the following areas:

- Maintenance Bays
- Indoor Agency Vehicle Parking
- Personal Vehicle Parking

Pros:

1. All interior (protected) bus storage, fuel and wash and circulation between these functions would be interior (protected).
2. Operational costs could be optimized for a fleet size that is 90% of what is desired in Phase 1.

Cons:

1. Reduced fleet size in Phase 1
2. Increased construction cost of Phase 3.

OPTION C

All items to remain the same as previously shown in space needs program for a fleet of 200 buses, except indoor agency vehicle parking would be canopy covered, with wind screens using openings for natural ventilation. This option would not provide a tempered, indoor space, but would lower the cost to under \$90M.

Pros:

1. Would accommodate storage of 200 buses.
2. Canopy covered area could be more easily converted to tempered, interior space in Phase 3.
3. Bus circulation would be "internal" to the storage area.

Cons:

1. Buses would be stored in a covered, but non-tempered, at times freezing, environment.
2. Storage building / area could be fairly uncomfortable in inclement weather.

Option A

INTRODUCTION

Project Description:

Concept Estimate for the construction of a New Bus Maintenance Facility on the site of the existing disused facility at Coolidge Terminal "preferred option" (Phase 1 costs only).

Project Particulars: The estimate is based on the following information

Concept / program space information received up to 13th July, 2017

Previous WSP projects of a similar nature

Project Assumptions:

- The estimate is intended to be used as menu of potential projects and it is expected that DDOT will select the projects that best fulfill their most urgent needs for earliest implementation and budget for the remaining in their long term Master-Plan via a phased implementation approach.
- The estimate assumes that the project will be LEED Certified
- The estimate assumes that the project will be a CM "at risk" using a standard DDOT Contract.
- The estimate assumes bona fide bid returns from no less than three qualified sub-contractors for each of the sub-bids or trade packages
- The Construction Cost reflects the fair construction value of this project in a competitive bidding market.
- Unit rates are based on current dollars, using prevailing wage Labor
- Subcontractor's markups have been included in each unit rate. Markups cover the cost of field overhead, home office overhead and subcontractor's profit and bonding
- Design and Pricing Contingency markup is an allowance for unforeseen design issues, design detail development and specification clarifications. **Set at 25% at the request of DDOT**
- General Conditions and Requirements, OCIP , Fee and bond values have been based on a percentage of construction costs
- Phase 1 (Coolidge Terminal) Assumed start of construction is April 2018
- *Future phases(excluded from this document)*
- Phase 2 (Shoemaker Terminal) Assumed start of construction is April 2020
- Phase 3 (Coolidge Terminal) Assumed start of construction is April 2024

Project Exclusions: Any of the following that are DDOT "Soft Costs" are itemized separately outside of the construction budget

- Licensed Site Professional
- *A/E fees including CA*
- *RE/Field Engineering*
- *Printing/Advertising*
- *Legal fees and land acquisition costs*
- *Commissioning, Testing & inspection*
- *Traffic Signals and Pedestrian Crossings*
- *Information Technology*
- *F,F and E*
- *Site Surveys*
- *Environmental*
- *Artwork*
- *Asset Management*
- *Peer reviews*
- *Owner Contingency*

INTRODUCTION

Project Description:

Concept Estimate for the construction of a New Bus Maintenance Facility on the site of the existing disused facility at Coolidge Terminal "preferred option" (Phase 1 costs only).

Project Particulars: The estimate is based on the following information

Concept / program space information received up to 13th July, 2017

Previous WSP projects of a similar nature

Project Assumptions:

The estimate is intended to be used as menu of potential projects and it is expected that DDOT will select the projects that best fulfill their most urgent needs for earliest implementation and budget for the remaining in their long term Master-Plan via a phased implementation approach.

- The estimate assumes that the project will be LEED Certified
- The estimate assumes that the project will be a CM "at risk" using a standard DDOT Contract.
- The estimate assumes bona fide bid returns from no less than three qualified sub-contractors for each of the sub-bids or trade packages
- The Construction Cost reflects the fair construction value of this project in a competitive bidding market.
- Unit rates are based on current dollars, using prevailing wage Labor
- Subcontractor's markups have been included in each unit rate. Markups cover the cost of field overhead, home office overhead and subcontractor's profit and bonding
- Design and Pricing Contingency markup is an allowance for unforeseen design issues, design detail development and specification clarifications. **Set at 25% at the request of DDOT**
- General Conditions and Requirements, OCIP , Fee and bond values have been based on a percentage of construction costs
- Phase 1 (Coolidge Terminal) Assumed start of construction is April 2018
- *Future phases(excluded from this document)*
- Phase 2 (Shoemaker Terminal) Assumed start of construction is April 2020
- Phase 3 (Coolidge Terminal) Assumed start of construction is April 2024

Project Exclusions: Any of the following that are DDOT "Soft Costs" are itemized separately outside of the construction budget

- Licensed Site Professional
- *A/E fees including CA*
- *RE/Field Engineering*
- *Printing/Advertising*
- *Legal fees and land acquisition costs*
- *Commissioning, Testing & inspection*
- *Traffic Signals and Pedestrian Crossings*
- *Information Technology*
- *F,F and E*
- *Site Surveys*
- *Environmental*
- *Artwork*
- *Asset Management*
- *Peer reviews*
- *Owner Contingency*

1.0 INTRODUCTION

The Michigan Department of Environmental Quality (MDEQ) retained Gannett Fleming of Michigan Inc. (Gannett Fleming) to conduct a limited subsurface investigation and evaluate remedial options to address contamination at the City of Detroit-DOT property, located at 14044 Schafer Highway in Detroit, Wayne County, Michigan (Figure 1). Due to recent financial hardship, the City of Detroit cannot conduct remedial activities and has been deemed a non-viable liable party. The State of Michigan has opted to take over the site characterization and remedial action at the site and has authorized Gannett Fleming to conduct remedial activities under the Level of Effort contract mechanism. This work was authorized by the Michigan Department of Technology, management & Budget under Purchase Order 761P2200040, dated October 7, 2011.

1.1 Site Background and Description

The City of Detroit – DOT property (also known as the Coolidge Terminal Facility) was operated as a bus storage and maintenance depot by the Detroit Department of Transportation (DDOT) as recently as January 2012. The site has been inactive since January 2012 to facilitate upgrades and modifications to the terminal. The property has operated as a bus terminal since at least the mid-1940's. Features of the site at the time of this investigation include a 150,000 square foot (approx.) main building used for fueling, storage, cleaning and service/maintenance of DDOT buses, and several smaller out-buildings including an administrative building, a fare box storage building, and a boiler/heating plant building. The remainder of the site is mostly paved with concrete or asphalt (Figure 2).

The area around the site is zoned for commercial and residential uses. Adjacent properties include a salvage yard to the west (across Schaefer Highway), a trucking / shipping company to the north, and residential properties to the south and east.

1.2 Underground Storage Tank Status

According to information provided by the MDEQ, 17 underground storage tanks (USTs) were installed at the site in 1946 and two more were installed in 1979-80. These USTs ranged in size from 500 to 50,000 gallons and contained various liquids, including

diesel fuel, gasoline, engine oil, convertor oil, Dexron (transmission fluid), used oil, and water. All of these tanks were removed or closed-in-place in late 1999 and early 2000.

Six new USTs were installed at the site in 2001 to replace those removed the previous year. These USTs are still in use, and include four 25,000-gallon diesel tanks, one 10,000-gallon gasoline tank and one 1,000 gallon used oil tank.

1.3 Release History and Corrective Actions

Five confirmed releases are on file for the site: three confirmed releases were reported in December 1999, one was reported in January 2000, and the last was reported in September 2006. The 1999 release were identified during construction activities around the USTs and involved several oil, diesel and gasoline tanks. The 2000 release occurred when a diesel transfer pipe failed near the northwest portion of the garage/service building, resulting in an emergency evacuation of personnel from the building. The 2006 release was related to a leaking diesel fuel clamp. No response activities are known to have been performed in response to the 2006 release. The volumes of these releases are unknown.

Interim response and site investigation activities were conducted at the site by The Traverse Group from 1999 through 2003. During the course of these investigations, 41 soil borings were advanced, seven temporary monitoring wells were installed, and 9 permanent monitoring wells were installed. Soil sample and groundwater data from these investigations indicated that contamination had migrated off-site to the property immediately north of and adjacent to the former USTs. In April 2003, petroleum free-product, or light non-aqueous phase liquid (LNAPL), was observed in monitoring well MW-15, located directly north of the main building, near the former fuel pump house, and at the northern property line. LNAPL thickness was monitored for six months, and in ten monitoring events, never exceeded 2.76 inches. Monitoring was terminated after October 2003, when product thickness had dropped to 0.24 inches. Six other monitoring wells were included in the LNAPL monitoring events, but LNAPL was only observed in MW-15.

These investigations conducted by the Traverse Group were summarized in the following reports:

- Initial Assessment Report (IAR) (March 20, 2000)

- Final Assessment Report (FAR) (December 31, 2001).
- Amended Final Assessment Report (AFAR) (August 29, 2003)
- Free Product Status Recovery Report (July 14, 2003)
- Free Product Status Recovery Report (October 19, 2003)

Based on information in the AFAR, 6,260 cubic yards of contaminated soil was removed during various site activities, including the closure of the former USTs and installation of the new USTs and communications line. This soil was disposed at the Waste Management Woodland Meadows facility, in Wayne, Michigan. In addition, 2,800 gallons of impacted groundwater and (estimated) 272 gallons of LNAPL were collected from the excavation pits and disposed off site.

The City of Detroit has not conducted any response activities since 2003. In 2008, the Traverse Group voluntarily waived its status as a Qualified UST Consultant, and is no longer involved with the remedial activities. According to MDEQ file notes, a Notice of Off-Site Migration was prepared and submitted to the property owner, but this could not be confirmed from information reviewed for this report.

2.0 OBJECTIVES

The primary objectives of the work at the site were determined during several meetings and communications with the MDEQ. These objectives are summarized below:

- Determine the nature and extent of soil and groundwater contamination at the site.
- Determine the present location of light non-aqueous phase liquid (LNAPL, or free product), if present, at the site.
- Assess the potential for and risk due to vapor intrusion into the on-site main building.
- Identify alternatives for remediating the LNAPL source area and the soil and groundwater contamination at the site.

During a September 21, 2011 meeting with the MDEQ, it was agreed that the initial phase of work would be limited to on-site activities, and that off-site investigations would occur at a later time, as necessary.

3.0 SUMMARY OF INVESTIGATION ACTIVITIES

3.1 Geophysical Survey

On January 27, 2012, Fibertec Environmental Services (Fibertec) conducted a geophysical survey using ground penetrating radar (GPR) and electromagnetic (EM) induction. This survey was performed in areas where subsurface investigations were to be conducted to locate underground utilities not marked by the MISS-DIG one-call system and to identify locations of USTs, both active USTs and closed-in-place. The GPR produced mixed results in attempts to identifying some utilities on site due to heavy rains producing puddles and saturated soil conditions the day prior to the survey. However, the GPR equipment was able to easily identify the existing and closed in place USTs. The EM survey was more successful at identifying the communications line and other small diameter piping and cable runs within the study. These subsurface features were marked using non-toxic paint so that they could be avoided during drilling.

3.2 Subsurface Investigation and Sampling

On January 30 through February 2, 2012, under supervision of Gannett Fleming personnel, Fibertec advanced 30 direct push soil borings (SB-1 through SB-30) (Figure 2). Ten borings, SB-1 through SB-10, were placed in the area near the southeast corner of the main building where three USTs were formerly located (former SE UST area). The other 20 borings, SB-11 through SB-30, were placed in the area north of the main building where the current USTs and most of the former USTs were located (North UST area). The former USTs in the SE UST area were closed and removed, while some of the former USTs in the North UST area were closed-in-place by filling with inert material.

Each soil boring was sampled continuously from the ground surface to the terminus of the boring using a five foot long by two inch diameter macro-core barrel equipped with disposable sample liners. Soil total depths of the soil borings ranged from 10 feet to 20 feet below ground surface (bgs). The core barrels were advanced in 5 foot intervals, after which they were removed and the soil was examined by the Gannett Fleming field geologist. Soil lithology, soil appearance and presence of staining, soil odors and photoionization detector (PID) readings, and other pertinent observations were recorded on soil boring logs. Soil lithology was described using the Unified Soil Classification System (USCS). Soil boring logs are presented in Appendix A.

Soil samples were obtained at two foot intervals along the entire vertical soil column and field-screened for the presence of volatile organic compounds using a PID calibrated to a 100 parts per million (ppm) isobutylene standard gas. PID screening results were used to provide qualitative relative comparisons of contaminants in soil between borings and depth intervals. PID results were also used to select the soil samples that would be submitted to the analytical laboratory for detailed analyses. The PID readings are included on the boring logs presented in Appendix A.

Where practicable, soil samples were collected for laboratory analysis from two intervals at each boring. One sample was generally collected from the interval that had the highest PID reading and a second sample from a deeper interval with a low PID reading to vertically delineate the extent of petroleum related constituents.

Groundwater samples were collected for laboratory analysis from temporary monitoring wells at soil boring locations that produced sufficient groundwater to collect a sample. Temporary monitoring wells were constructed of 1-inch PVC casing directly installed into the soil boring. Only three of the 30 soil borings, SB-5, SB-17 and SB-18, contained sufficient groundwater to warrant installation of temporary monitoring wells and collection of groundwater samples.

A total of 58 soil samples and 3 groundwater samples were collected from the 30 soil borings advanced during this phase of the subsurface investigation. All samples were submitted to the MDEQ Environmental Laboratory in Lansing, Michigan. All soil and groundwater samples collected were analyzed for BTEX, MTBE, and TMBs by USEPA Solid Waste SW-846 Method 8260; polynuclear aromatic hydrocarbons (PNAs) by USEPA SW-846 Method 8270; and lead by USEPA SW-846 Method 6020. One soil sample, SB-3 (2-4) was analyzed for diesel range organics and gasoline range organics by USEPA SW-846 Method 8015 and for TCLP VOCs and TCLP metals. All samples were placed on ice and delivered to the laboratory following Gannett Fleming's chain-of-custody protocol. Soil and groundwater analytical results for samples collected during soil boring advancement are summarized in Tables 1 and 2 and presented graphically on Figures 3 and 4. Copies of the laboratory reports are provided in Appendix B.

3.3 Soil Gas Probe Installation

Gannett Fleming originally planned on converting soil borings SB-28, SB-29 and SB-30 to soil gas sampling points to evaluate the volatilization to indoor air vapor inhalation pathway inside the main building. Sub-slab samples inside the main building were considered unfeasible due to the high levels of ambient VOC concentrations inside the maintenance/fueling areas. Therefore, soil gas probes outside the building foundation/footer, between the USTs and the building, were deemed a more practical approach to assess this pathway. During drilling, ubiquitous shallow (< 4 feet) thick clay was found beneath the site with somewhat more permeable fill above. This clay had a porosity too low to transmit vapors to the soil gas probes, and the overlying fill was too saturation with water to allow soil gas collection. Because of these geological conditions, the soil gas probes were considered impractical for their intended use and eliminated from the investigation plan. Soil samples were collected from the terminus (10 feet bgs) of these borings in lieu of gas samples. Boring logs and analytical results from SB-28 through SB-30 are summarized in Table 1 and Figure 3 and the laboratory reports are included as Appendix B.

3.4 Groundwater Sampling-February 2012

During the subsurface investigation Gannett Fleming personnel located 3 of the 4 existing on-site permanent monitoring wells at the site (Figure 2). Two wells (MW-2 and MW-3) were located east of the SE UST area, and one (MW-7) was located in the North UST area. MW-15, which was the focus of LNAPL monitoring from 2002 through 2003, was not found at the location shown on earlier maps. Groundwater samples were collected from MW-2, MW-3 and MW-7 on February 8, 2012 following low flow groundwater sampling procedures. A peristaltic pump and disposable tubing was used to purged groundwater in each well through a flow through cell where a YSI analyzer was used to monitor water temperature, pH, ORP dissolved oxygen and conductivity. Once these parameters were stabilized for three consecutive readings, the tubing was disconnected from the flow through cell and groundwater samples were placed directly into laboratory supplied sample containers.

The three on-site monitoring well groundwater samples were submitted to the MDEQ Laboratory and analyzed for BTEX, MTBE, and TMBs by USEPA Solid Waste SW-846 Method 8260; polynuclear aromatic hydrocarbons (PNAs) by USEPA SW-846 Method 8270; and lead by USEPA SW-846 Method 6020. All samples were placed on ice and

delivered to the laboratory following Gannett Fleming's chain-of-custody protocol. Groundwater analytical results from these monitoring well samples are summarized in Table 3 and presented graphically on Figure 4. Copies of the laboratory reports are provided in Appendix B.

3.5 Groundwater Sampling-August 2012

On August 17, 2012, after obtaining access to conduct investigation activities at the Frisbie Moving & Storage (Frisbie) property, Gannett Fleming personnel returned to the site to conduct follow-up groundwater and LNAPL monitoring activities at the DDOT property and the off-site Frisbie property. Field staff again attempted to locate MW-15 using an electromagnetic wand to detect the steel well cover. After extensive probing and searching, MW-15 still could not be found. The presence of relatively new concrete over the area where MW-15 was supposed to be located suggests that MW-15 may have been covered or destroyed during various site modifications since 2003.

The five off-site monitoring wells installed in 2002 (MW-10, MW-11, MW-12, MW-13, and MW-14) were located in the Frisbie Moving & Storage parking lot. These five wells and the three on-site wells (MW-2, MW-3 and MW-7) were sampled on August 17, 2012, following low flow groundwater sampling procedures, as described above. A peristaltic pump or bladder pump with disposable tubing was used to purged groundwater in each well and collect the samples

The eight monitoring well groundwater samples were submitted to the MDEQ Laboratory and analyzed for BTEX, MTBE, TMBs and polynuclear aromatic hydrocarbons (PNAs) as described above. Groundwater analytical results from these monitoring well samples are summarized in Table 3 and presented graphically on Figure 4. Copies of the laboratory reports are provided in Appendix B.

3.6 LNAPL Gauging

LNAPL was not detected in any of the monitoring wells identified on the site. A separate recovery sump containing used oil was identified on site, but this sump was an integrated component of an oil-water separator skimmer recovery system. At the time of the subsurface investigation LNAPL was not observed in any of the borings drilled and it did not appear to be migrating away from the oil water separator and recovery

sump. Monitoring well MW-15, which reportedly contained 0.1-0.2 inches of free product in 2003 could not be found, and is believed to be buried or destroyed.

4.0 DISCUSSION OF ANALYTICAL RESULTS

The analytical results from the limited subsurface investigation were compared to Part 213 Tier I non-residential risk based screening levels (RBSLs) for soil and groundwater under Michigan 1994 P.A. 451, as amended. Although residential properties border the site to the south and east, the areas where contamination are present are a considerable distance from these properties, and the areas of investigation are not likely to be repurposed for residential use in the foreseeable future.

The Tier I non-residential RBSLs were used for an initial comparison during this investigation, with the understanding that these RBSLs may not be appropriate at very high concentrations where LNAPL may be present.

Soil pathways considered relevant for this site included groundwater-surface water interface protection (GSIP), soil volatilization to indoor air inhalation (SVIAI), and direct contact (DC). While not specifically a pathway, the soil saturation concentration screening levels (CSAT) were included to evaluate the potential for LNAPL to be present. It should be noted that the CSAT values are applicable only to single compound concentrations, and may not be valid where chemical mixtures are present.

Groundwater pathways considered relevant for this site included groundwater-surface water interface (GSI), volatilization to indoor air inhalation (VIAI), and groundwater contact (GDC). Drinking water is not considered relevant at this site because the entire area is serviced by municipal water and is in an area where groundwater is not considered to be in an aquifer, and hence is not a potable source.

4.1 Soil Analytical Results

Analytical data from soil samples collected during the subsurface investigation indicated 14 of 30 soil borings contain concentrations of VOCs and/or PNAs above Part 213 RBSLs for relevant pathways (Figure 3). The samples collected from SB-13(2-4) and SB-30(2-4) exceeded the GSIP, SVIAI, DC, and CSAT RBSLs. All other samples exceeded only the GSIP RBSL. Most of the samples with elevated concentrations and

levels above RBSLs were collected from the upper 2 to 6 feet of fill material, or from the shallowest part of the clay unit. The contamination appears to be distributed to shallow depths, possibly indicative of surface spills of petroleum infiltrating through cracks in the concrete or releases from shallow pipelines accumulating in the fill or on top of the clay directly below the concrete surface. One sample, SB-3(2-4), was analyzed for diesel range organics (DRO) and oil range organics (ORO). DRO results were 500,000 µg/kg (500 mg/kg) and ORO results were 3,500,000 µg/kg (3,500 mg/kg). These are relatively high values and could be indicative of remnant diesel fuel LNAPL in soil pore spaces.

4.2 Groundwater Analytical Results

Six groundwater samples were collected in January-February 2012: three were collected from soil borings (SB-5, SB-17 and SB-18) and the remaining three were collected from the on-site monitoring wells (MW-2, MW-3, and MW-7). The sample collected from SB-5 was the only groundwater sample containing any compound above an RBSL. 1,2,4-trimethylbenzene was reported at 25 µg/L, which is above the GSI RBSL. This sample also contained other compound, including 1,3,5-trimethylbenzene (3.9 µg/L), benzene (25 µg/L), ethylbenzene (12 µg/L), xylenes (17.4 µg/L), naphthalene (4 µg/L), and pyrene (1 µg/L), all at concentrations below the RBSLs. Trace concentrations of various trimethylbenzene compounds were detected in the samples collected from MW-2 and MW-3, but at levels below any RBSLs. None of the other groundwater samples contained VOCs, PNAs or metals above laboratory method detection limits or selected RBSLs.

Eight groundwater samples were collected from all on-site and off-site monitoring wells on August 17, 2012. Of these, only two contained petroleum hydrocarbon compounds above the laboratory method detection limit. The groundwater sample collected from MW-11 contained naphthalene at 9.9 µg/L and benzene at 3.5 µg/L. Both of these concentrations are below the selected RBSLs. MW-11 is an off-site well located across the property line from on-site MW-15, a well which formerly contained LNAPL. The groundwater sample collected from MW-12 contained the highest concentrations of petroleum compounds, including naphthalene at 30 µg/L, benzene at 4,500 µg/L, toluene at 11 µg/L, ethylbenzene at 330 µg/L, 1,2,3-trimethylbenzene at 39 µg/L, 1,2,4-trimethylbenzene at 200 µg/L, 1,3,5-trimethylbenzene at 33 µg/L and total xylenes at 232 µg/L. Of these, the naphthalene, benzene, ethylbenzene, 1,3,4-trimethylbenzene and

xylenes concentrations exceed the GSI RBSL. None of the other six groundwater samples collected from on-site and off-site monitoring wells contained VOCs or PNAs above laboratory method detection limits.

5.0 FEASIBILITY STUDY

5.1 Exposure Pathway Characterization

The potential sources of exposure at the facility are impacted soil and shallow groundwater. Potential transport mechanisms include volatilization and atmospheric dispersion, volatilization and closed space accumulation, soil leaching to groundwater, groundwater transport, and migration along utility corridors.

Soil or groundwater ingestion, direct contact with impacted soil or groundwater, and inhalation of volatilized constituents would be potential exposure routes. Potential receptors to the exposure routes would include construction workers, commercial utility workers, personnel working in nearby structures, and underground utilities (especially storm sewers).

5.2 Feasibility Analysis

A feasibility analysis was performed to determine the appropriate corrective action for the site. This analysis considered each option in terms of effectiveness of cleanup, duration, and cost.

5.2.1 Soil Corrective Action Alternatives

Natural Attenuation: Impacted soils could remain in-place since there is a concrete cover over all impacted areas and existing monitoring wells could be monitored on a regular basis. This alternative requires continued maintenance of the concrete and does not provide cleanup for contaminated soils detected above RBSLs along the property boundary and off-site. This alternative will not eliminate acute risks to human health and to the environment without institutional or engineering controls. Institutional controls to prevent significant changes to the land use may eventually be required and due care provisions may proscribe engineering controls to address the volatilization to indoor air inhalation pathway if it is determined to be complete. Natural attenuation is considered a viable alternative if it can be demonstrated that all relevant pathways are securely closed. The cost for this alternative is lower than other alternatives and the exposure risks to human health and the environment can be managed using institutional controls, engineering controls (e.g. indoor ventilation systems and

impermeable barriers), and monitoring (e.g. groundwater wells, soil gas points, and storm drains at the property boundaries).

Soil Excavation: Impacted soil could be excavated and removed to a disposal facility. This would require the excavation and disposal of approximately 1,000 to 2,000 cubic yards or more of soil, filling the excavated areas with clean backfill and replacing demolished concrete. The cost to conduct this alternative and replace newly installed concrete on-site and off-site is considered relatively high. The areas where soil is impacted above RBSLs are not contiguous across the site and are in areas occupied by USTs that have been closed in place, close to or under foundations, or in areas occupied by underground equipment and utilities. Excavation would be very difficult and expensive, considering that underground fuel pipes, USTs (active and closed in place), oil-water separators, storm drains, fiber-optic cables, and other utilities are in the area of soil impacts. Although this alternative would be effective and could complete remediation within a short timeframe, excavation is considered costly, impracticable, and is not recommended.

Soil Vapor Extraction/Air Sparging: Soil vapor extraction (SVE) is an alternative that can reduce the volume of petroleum hydrocarbons in the soil, and to a lesser degree, in groundwater. Vent wells would be installed in the area of impacted soil and connected to a vacuum blower that would discharge through activated carbon, a catalytic oxidizer, or other vapor treatment apparatus, before venting to the atmosphere under the provisions of an air quality permit. Separate vapor treatment systems would be required at the North UST area and the SE UST areas. The vapor collection system would require a vast network of underground piping, buildings, electrical power, and would need to be monitored and maintained on a very frequent basis.

SVE is best implemented in conjunction with air sparging or ozone sparging, where air or ozone is forced under pressure into the saturated soils. The micro-bubbles strip hydrocarbons from the saturated soils and groundwater and ideally carry the contaminant in vapor phase to the unsaturated zone where it is collected by the SVE system.

The Soil Vapor Extraction/air sparging alternative is not viable for several reasons: depth to water in the shallow fill materials is insufficient to allow high volumes of vapor from the unsaturated zone. Significant water would be pulled into the system resulting in high maintenance effort and inefficient operation. The impermeable nature of the native clays underlying shallow fill will not support air sparging, which requires a reasonable soil permeability to be effective. Therefore, this alternative is not recommended.

5.2.2 Groundwater and LNAPL Corrective Action Alternatives

Monitored Natural Attenuation: The extent of contaminated groundwater has not increased between the last sampling events in 2002-2003 and the most recent sampling events in 2012. Groundwater occurs only in the shallow fill materials to a depth of 4-6 feet and may not have a migration pathway away from the release areas. With the extent of groundwater contamination remaining stable, it is likely that natural attenuation is taking place.

However, the groundwater concentrations of hydrocarbons, even the more soluble and volatile components like benzene, have not decreased over this same time period. The consistent concentrations of dissolved phased compounds over time suggests that LNAPL is trapped in soil pore spaces near the former release locations and acting as a continuing source of dissolved phase contaminants. Groundwater contamination is prevented from spreading vertically by extensive impermeable clays and is stable horizontally due to natural attenuation and possibly geological physical constraints. Risks associated with groundwater contamination at this site are minimal, with the possible exception of the GSI pathway via storm sewers. Natural attenuation of groundwater and LNAPL is a viable alternative for this site, so long as monitoring and suitable due-care provisions are employed to detect changes in groundwater conditions and steps are taken to mitigate migration through preferential pathways. This option assumes no changes in current land use.

In-Situ Chemical Oxidation and Bioremediation: Petroleum hydrocarbons can be destroyed in place through in-situ chemical oxidation (ISCO) or by in-situ bioremediation. Both processes involve injecting mixtures of chemicals and/or nutrients into the impacted subsurface soils.

In the case of ISCO, an oxidizing compound is injected into the impacted zone to cause a Fenton's reaction to chemically oxidize and destroy hydrocarbons, reducing them to carbon dioxide, water, and other benign oxidation by-products. The concentrations of contaminants and the presence of LNAPL do not affect the effectiveness of ISCO, except in the quantity of ISCO product that would be required to oxidize higher concentrations of contaminants. Natural oxygen demand (COD, BOD, etc.) would need to be considered in planning any ISCO implementation. ISCO is toxic to organisms, and could temporarily deplete the population of soil microbes that may currently be degrading hydrocarbons. Initial applications of ISCO often cause an initial release of contaminants from an immobile state to a dissolved mobile state, and concentration rebounds are not uncommon, requiring multiple rounds of application. Because ISCO is an oxidation process, significant heat can be generated and corrosion to underground utilities can occur, depending on the strength of oxidant used.

In the case of in-situ bioremediation, nutrients and electron acceptors are injected into the subsurface, modifying the environment to stimulate growth of naturally occurring pre-existing aerobic or anaerobic bacteria capable of breaking down hydrocarbons through metabolic or co-metabolic processes. It is important to understand the current micro-environment to properly implement bioremediation and additional studies would be necessary to determine the amendments that would achieve the desired results. Areas where contaminant concentrations are high may be more anaerobic, while other areas may be in an aerobic environment. LNAPL is often toxic to some bacteria and bioremediation may be less effective where LNAPL or very high dissolved concentrations exist. Multiple applications of bio-stimulants are often necessary for best results.

Both technologies can be implemented without the installation of an extensive subsurface infrastructure. Repeat applications are possible, and usually necessary. Of the two methods, ISCO may be more practical at this site in that only the oxygen demand is a requisite factor for planning ISCO, and ISCO can be effective in both soil and groundwater. However, many of the same site conditions that limit the effective use of soil vapor extraction hinder the effective use of both ISCO and in-situ bioremediation. The widespread nature of the contaminant in isolated pockets across

the site, unknown bio-geochemical conditions at the site, and the impermeability of the native clays would make this option difficult to implement. Therefore, these alternatives are not recommended.

Groundwater / LNAPL Pump and Treat: A groundwater / LNAPL collection system could collect LNAPL and contaminated water, separate the water from LNAPL, and treat impacted groundwater by using activated carbon or other treatment alternative to remove petroleum hydrocarbons. The shallow thickness of the permeable fill would result in very limited radius of influence for any pumping system, and would necessarily have to operate at very low recovery rates. Any groundwater / LNAPL pump & treat system will be expensive to install and operate, and would require a permitted discharge to sanitary or storm water sewers. LNAPL would need to be collected as disposed by a licensed waste disposal contractor. The groundwater pump and treat alternative is not viable due to the limited thickness of the water bearing fill materials and the low hydraulic conductivity of the underlying native clays. Therefore, this alternative is not recommended for corrective action at the site.

Air/Ozone Sparging: An air or ozone sparging system for groundwater remediation strips volatile organic hydrocarbons from soil and groundwater in the saturated zone and transports the contaminants to the vadose zone where vapors are collected by an SVE system. Ozone is a strong oxidizing agent and ozone sparging has the added benefit of adding a limited ISCO process to the remediation efforts. Air/Ozone sparging is not viable due to the limited thickness of the water bearing fill materials and the low hydraulic conductivity of the underlying native clays. Therefore, this alternative is not recommended for corrective action at the site.

5.3 Feasibility Analysis Comparison Table

Corrective Action Alternative	Cost	Effectiveness	Duration
Soil Excavation	High	Good	Immediate
SVE - Air/Ozone Sparging	High	Poor	Moderate
Monitored Natural Attenuation	Low	Fair	Long-Term
GW/LNAPL Pump & Treat	High	Poor	Long-Term
ISCO / Bioremediation	Moderate	Poor	Short-Term

The selected corrective action alternative is Monitored Natural Attenuation with appropriate due care provisions. Given the current land use and the land use in the foreseeable future, and the stable and immobile nature of the soil and groundwater contaminants, this alternative is the most appropriate choice. Monitored natural attenuation is cost effective and can be implemented without immediate concerns of unacceptable risks to human health and the environment. Due-care requirements must be emplaced for this alternative to be protective. These may involve some additional investigation to determine whether storm water sewers in contact with contaminants pose a GSI risk, and to evaluate indoor air inhalation risks associated with residual soils. Because the garage already uses an indoor ventilation system in compliance with OSHA and MIOSHA worker safety regulations, there may be no risks to site workers from volatilization of contaminants from the subsurface. If monitoring shows that site conditions change or if exposure risks are shown to be higher than anticipated, excavation would be the best fallback alternative.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

5 = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s); RL raised.

J = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Bolded indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

5 = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s); RL raised.

J = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Bolded indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

5 = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s); RL raised.

J = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Bolded indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

5 = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s); RL raised.

J = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Bolded indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

5 = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s); RL raised.

J = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Bolded indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

APPENDIX B
Analytical Reports

February 03, 2012

Mr. Pewu Bah-Deh
MDEQ
27700 Donald Ct.
Warren, MI 49092

RE: Trace Project T12A272
MDEQ Site 82002470 / City of Detroit -DOT

Dear Mr. Bah-Deh:

Enclosed are the analytical results that represent the completed report for the above project. All analyses were completed at Trace Analytical Laboratories, Inc.

The sample was received on 1/31/2012 13:20 PM , in good condition, correctly labeled and properly preserved. Any problems encountered during sample receipt are addressed in the enclosed Sample Log-In Checklist.

Every practical effort was made to meet the quality control requirements of each analytical method and the reporting limit specifications of the project. The analytical data associated with this project has been reviewed for accuracy, precision, and completeness. Methods used for analyses are indicated on analytical reports. A Statement of Data Qualifications Section is provided for any data that required qualification.

Ms. Gina M. Roe has reviewed the QA/QC results associated with the analysis of these samples. To the best knowledge of the signer, the QA/QC data are complete and accurate. The review was completed on February 03, 2012.

If you have questions or require further information, please contact me at 231.773.5998 or by email at groe@trace-labs.com.

Sincerely,

Gina M. Roe
Laboratory Manager

QUALIFIER KEY
DEFINITIONS

<, ND or U	Indicates the compound was analyzed for but not detected.
*	Indicates a result that exceeds its associated MCL or Surrogate control limits.
N	Indicates that the compound has not been evaluated by NELAC.
NA	Indicates that the compound is not available.
RDL	Reporting Detection Limit
MCL	Maximum Contamination Limit
TIC	Tentatively Identified Compound
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
RPD	Relative Percent Difference

SAMPLE LOG IN CHECKLIST

Date: 1-31-12 Client Name: MDEO # of Coolers: 1
Trace ID #: T12A272 Project Name: _____ Cooler #s: _____
Logged in by: [Signature] Cooler #s: _____

Cooler Receipt

Cooler/samples delivered by: Trace courier Hand delivered Commercial courier Name of delivery person: Tim B
UPS DHL FED EX US Mail
Did cooler come with a bill of lading? No Yes Not Applicable
Way Bill or Tracking #: _____
COC Seals present and intact on cooler? No Yes Not Applicable
Custody seals signed by Client? No Yes Client custody seal # (if applicable): _____

Coolant and Temperature

Type of Coolant Used		Cooler Temperature	Correction Factor <u>+0.2</u> °C
Yes	No	Date: <u>1-31-12</u>	Time: <u>15:22</u>
Slurry w/ crushed, cubed, or chip ice? <input type="checkbox"/>	<input type="checkbox"/>	Temperature Blank: <u>7.8</u> °C	
Multiple bags of ice around samples? <input checked="" type="checkbox"/>	<input type="checkbox"/>	Range of 3 samples: <u>1, 0</u> °C	
Ice Packs/ Blue Ice: <input type="checkbox"/>	<input type="checkbox"/>	Melt Water: _____ °C	
No Coolant Present: <input type="checkbox"/>		Ice still present upon receipt: <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No	

General

	Yes	No	NA
COC taped to inside of cooler lid?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
All bottles arrived unbroken with labels in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Each sample point is in a sealed plastic bag?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Labels filled out completely?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
All bottle labels agree with Chain of Custody (COC)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Sufficient sample to run tests requested?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
pH checked and samples at correct pH?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Correct preservative added to samples?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
DRO/GRO samples received and appropriate check in form completed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Air bubbles absent from VOAs?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
COC filled out properly and signed by client?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
COC signed in by TRACE sample custodian?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Was project manager called and samples discussed?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Gina Roe

From: Savage, Craig A. [csavage@GFNET.com]
Sent: Tuesday, January 31, 2012 4:21 PM
To: groe@trace-labs.com
Subject: TCLP DDOT facility, Detroit

Hi Gina,

In response to your questions about the TCLP/SPLP samples submitted to you from the State Laboratory for the DDOT Schaefer Hwy (Coolidge) Site, please run only TCLP for volatiles and RCRA-8 metals. This sample is to have information available for waste disposal firms to obtain approval for landfill disposal. Call with any questions. Thanks.

<u>Qualifier Code</u>	<u>Qualifier Description</u>
1	Result(s) and RL(s) are estimated due to low surrogate recovery.
2	Result is estimated due to high surrogate recovery.
3	Result(s) and RL(s) are estimated due to low matrix spike recovery.
4	Result is estimated due to high matrix spike recovery.
5	Result and RL are estimated due to low continuing calibration standard criteria failure.
6	Result is estimated due to high continuing calibration standard criteria failure.
7	Result(s) and RL(s) are estimated due to poor precision.
8	Result(s) and RL(s) are estimated due to low recovery of batch QC.
9	Result outside QC acceptance criteria.
A	Value reported is the mean of two or more determinations.
C	Value calculated from other independent parameters.
D	Analyte value quantified from a dilution(s); reporting limit (RL) raised.
E	Result is estimated due to high recovery of batch QC.
F	Amenable cyanide was not analyzed due to low level of total cyanide.
G	Result and RL are estimated due to initial calibration standard criteria failure.
H	Recommended laboratory holding time was exceeded.
I	Dilution required due to matrix interference; reporting limit (RL) raised.
J	Analyte was positively identified. Value is an estimate.
JA	Result is estimated due to multiple Aroclors present.
JC	Result is estimated since confirmation analysis did not meet acceptance criteria
JD	Due to severe degradation, specific Aroclor identification is difficult and quantitation is estimated.
K	RL(s) raised due to matrix interferences.
KR	RL(s) raised due to low sample volume submitted.
KS	RL(s) raised due to low total solids.
KW	RL(s) raised due to light sample weight.
LB	Reported library search compounds are tentative identifications with estimated concentrations.
M	The level of the method preparation blank (MPB) is reported in the qualifier column.
N	Non-homogeneous sample made analysis of sample questionable.
O	Result and RL estimated due to analysis from an open vial.
P	Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
PI	Possible interference may have affected the accuracy of the laboratory result
Q	Quantity of sample insufficient to perform analyses requested.
R	Result confirmed by re-extraction and analysis.
S	Supernatant analyzed.
T	Reported value is less than the reporting limit (RL). Result is estimated.
V	Value not available due to dilution.
W	Reported value is less than the method detection limit (MDL).
X	Methods 8260 & 624 are used to analyze volatile organics that have boiling points below 200°C. 2-Methylnaphthalene & naphthalene have boiling points above 200°C and are better suited to analysis by methods 8270 or 625 as semivolatile organics.
Z	Result reported below the RL to meet the TDL in RRD Op Memo 2 (10/22/04) multiplied by applicable dilution factor.

<u>Qualifier Code</u>	<u>Qualifier Description</u>
1	Result(s) and RL(s) are estimated due to low surrogate recovery.
2	Result is estimated due to high surrogate recovery.
3	Result(s) and RL(s) are estimated due to low matrix spike recovery.
4	Result is estimated due to high matrix spike recovery.
5	Result and RL are estimated due to low continuing calibration standard criteria failure.
6	Result is estimated due to high continuing calibration standard criteria failure.
7	Result(s) and RL(s) are estimated due to poor precision.
8	Result(s) and RL(s) are estimated due to low recovery of batch QC.
9	Result outside QC acceptance criteria.
A	Value reported is the mean of two or more determinations.
C	Value calculated from other independent parameters.
D	Analyte value quantified from a dilution(s); reporting limit (RL) raised.
E	Result is estimated due to high recovery of batch QC.
F	Amenable cyanide was not analyzed due to low level of total cyanide.
G	Result and RL are estimated due to initial calibration standard criteria failure.
H	Recommended laboratory holding time was exceeded.
I	Dilution required due to matrix interference; reporting limit (RL) raised.
J	Analyte was positively identified. Value is an estimate.
JA	Result is estimated due to multiple Aroclors present.
JC	Result is estimated since confirmation analysis did not meet acceptance criteria
JD	Due to severe degradation, specific Aroclor identification is difficult and quantitation is estimated.
K	RL(s) raised due to matrix interferences.
KR	RL(s) raised due to low sample volume submitted.
KS	RL(s) raised due to low total solids.
KW	RL(s) raised due to light sample weight.
LB	Reported library search compounds are tentative identifications with estimated concentrations.
M	The level of the method preparation blank (MPB) is reported in the qualifier column.
N	Non-homogeneous sample made analysis of sample questionable.
O	Result and RL estimated due to analysis from an open vial.
P	Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
PI	Possible interference may have affected the accuracy of the laboratory result
Q	Quantity of sample insufficient to perform analyses requested.
R	Result confirmed by re-extraction and analysis.
S	Supernatant analyzed.
T	Reported value is less than the reporting limit (RL). Result is estimated.
V	Value not available due to dilution.
W	Reported value is less than the method detection limit (MDL).
X	Methods 8260 & 624 are used to analyze volatile organics that have boiling points below 200°C. 2-Methylnaphthalene & naphthalene have boiling points above 200°C and are better suited to analysis by methods 8270 or 625 as semivolatiles organics.
Z	Result reported below the RL to meet the TDL in RRD Op Memo 2 (10/22/04) multiplied by applicable dilution factor.

<u>Qualifier Code</u>	<u>Qualifier Description</u>
1	Result(s) and RL(s) are estimated due to low surrogate recovery.
2	Result is estimated due to high surrogate recovery.
3	Result(s) and RL(s) are estimated due to low matrix spike recovery.
4	Result is estimated due to high matrix spike recovery.
5	Result and RL are estimated due to low continuing calibration standard criteria failure.
6	Result is estimated due to high continuing calibration standard criteria failure.
7	Result(s) and RL(s) are estimated due to poor precision.
8	Result(s) and RL(s) are estimated due to low recovery of batch QC.
9	Result outside QC acceptance criteria.
A	Value reported is the mean of two or more determinations.
C	Value calculated from other independent parameters.
D	Analyte value quantified from a dilution(s); reporting limit (RL) raised.
E	Result is estimated due to high recovery of batch QC.
F	Amenable cyanide was not analyzed due to low level of total cyanide.
G	Result and RL are estimated due to initial calibration standard criteria failure.
H	Recommended laboratory holding time was exceeded.
I	Dilution required due to matrix interference; reporting limit (RL) raised.
J	Analyte was positively identified. Value is an estimate.
JA	Result is estimated due to multiple Aroclors present.
JC	Result is estimated since confirmation analysis did not meet acceptance criteria
JD	Due to severe degradation, specific Aroclor identification is difficult and quantitation is estimated.
K	RL(s) raised due to matrix interferences.
KR	RL(s) raised due to low sample volume submitted.
KS	RL(s) raised due to low total solids.
KW	RL(s) raised due to light sample weight.
LB	Reported library search compounds are tentative identifications with estimated concentrations.
M	The level of the method preparation blank (MPB) is reported in the qualifier column.
N	Non-homogeneous sample made analysis of sample questionable.
O	Result and RL estimated due to analysis from an open vial.
P	Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
PI	Possible interference may have affected the accuracy of the laboratory result
Q	Quantity of sample insufficient to perform analyses requested.
R	Result confirmed by re-extraction and analysis.
S	Supernatant analyzed.
T	Reported value is less than the reporting limit (RL). Result is estimated.
V	Value not available due to dilution.
W	Reported value is less than the method detection limit (MDL).
X	Methods 8260 & 624 are used to analyze volatile organics that have boiling points below 200°C. 2-Methylnaphthalene & naphthalene have boiling points above 200°C and are better suited to analysis by methods 8270 or 625 as semivolatiles organics.
Z	Result reported below the RL to meet the TDL in RRD Op Memo 2 (10/22/04) multiplied by applicable dilution factor.

<u>Qualifier Code</u>	<u>Qualifier Description</u>
1	Result(s) and RL(s) are estimated due to low surrogate recovery.
2	Result is estimated due to high surrogate recovery.
3	Result(s) and RL(s) are estimated due to low matrix spike recovery.
4	Result is estimated due to high matrix spike recovery.
5	Result and RL are estimated due to low continuing calibration standard criteria failure.
6	Result is estimated due to high continuing calibration standard criteria failure.
7	Result(s) and RL(s) are estimated due to poor precision.
8	Result(s) and RL(s) are estimated due to low recovery of batch QC.
9	Result outside QC acceptance criteria.
A	Value reported is the mean of two or more determinations.
C	Value calculated from other independent parameters.
D	Analyte value quantified from a dilution(s); reporting limit (RL) raised.
E	Result is estimated due to high recovery of batch QC.
F	Amenable cyanide was not analyzed due to low level of total cyanide.
G	Result and RL are estimated due to initial calibration standard criteria failure.
H	Recommended laboratory holding time was exceeded.
I	Dilution required due to matrix interference; reporting limit (RL) raised.
J	Analyte was positively identified. Value is an estimate.
JA	Result is estimated due to multiple Aroclors present.
JC	Result is estimated since confirmation analysis did not meet acceptance criteria
JD	Due to severe degradation, specific Aroclor identification is difficult and quantitation is estimated.
K	RL(s) raised due to matrix interferences.
KR	RL(s) raised due to low sample volume submitted.
KS	RL(s) raised due to low total solids.
KW	RL(s) raised due to light sample weight.
LB	Reported library search compounds are tentative identifications with estimated concentrations.
M	The level of the method preparation blank (MPB) is reported in the qualifier column.
N	Non-homogeneous sample made analysis of sample questionable.
O	Result and RL estimated due to analysis from an open vial.
P	Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
PI	Possible interference may have affected the accuracy of the laboratory result
Q	Quantity of sample insufficient to perform analyses requested.
R	Result confirmed by re-extraction and analysis.
S	Supernatant analyzed.
T	Reported value is less than the reporting limit (RL). Result is estimated.
V	Value not available due to dilution.
W	Reported value is less than the method detection limit (MDL).
X	Methods 8260 & 624 are used to analyze volatile organics that have boiling points below 200°C. 2-Methylnaphthalene & naphthalene have boiling points above 200°C and are better suited to analysis by methods 8270 or 625 as semivolatile organics.
Z	Result reported below the RL to meet the TDL in RRD Op Memo 2 (10/22/04) multiplied by applicable dilution factor.

<u>Qualifier Code</u>	<u>Qualifier Description</u>
1	Result(s) and RL(s) are estimated due to low surrogate recovery.
2	Result is estimated due to high surrogate recovery.
3	Result(s) and RL(s) are estimated due to low matrix spike recovery.
4	Result is estimated due to high matrix spike recovery.
5	Result and RL are estimated due to low continuing calibration standard criteria failure.
6	Result is estimated due to high continuing calibration standard criteria failure.
7	Result(s) and RL(s) are estimated due to poor precision.
8	Result(s) and RL(s) are estimated due to low recovery of batch QC.
9	Result outside QC acceptance criteria.
A	Value reported is the mean of two or more determinations.
C	Value calculated from other independent parameters.
D	Analyte value quantified from a dilution(s); reporting limit (RL) raised.
E	Result is estimated due to high recovery of batch QC.
F	Amenable cyanide was not analyzed due to low level of total cyanide.
G	Result and RL are estimated due to initial calibration standard criteria failure.
H	Recommended laboratory holding time was exceeded.
I	Dilution required due to matrix interference; reporting limit (RL) raised.
J	Analyte was positively identified. Value is an estimate.
JA	Result is estimated due to multiple Aroclors present.
JC	Result is estimated since confirmation analysis did not meet acceptance criteria
JD	Due to severe degradation, specific Aroclor identification is difficult and quantitation is estimated.
K	RL(s) raised due to matrix interferences.
KR	RL(s) raised due to low sample volume submitted.
KS	RL(s) raised due to low total solids.
KW	RL(s) raised due to light sample weight.
LB	Reported library search compounds are tentative identifications with estimated concentrations.
M	The level of the method preparation blank (MPB) is reported in the qualifier column.
N	Non-homogeneous sample made analysis of sample questionable.
O	Result and RL estimated due to analysis from an open vial.
P	Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
PI	Possible interference may have affected the accuracy of the laboratory result
Q	Quantity of sample insufficient to perform analyses requested.
R	Result confirmed by re-extraction and analysis.
S	Supernatant analyzed.
T	Reported value is less than the reporting limit (RL). Result is estimated.
V	Value not available due to dilution.
W	Reported value is less than the method detection limit (MDL).
X	Methods 8260 & 624 are used to analyze volatile organics that have boiling points below 200°C. 2-Methylnaphthalene & naphthalene have boiling points above 200°C and are better suited to analysis by methods 8270 or 625 as semivolatile organics.
Z	Result reported below the RL to meet the TDL in RRD Op Memo 2 (10/22/04) multiplied by applicable dilution factor.

<u>Qualifier Code</u>	<u>Qualifier Description</u>
1	Result(s) and RL(s) are estimated due to low surrogate recovery.
2	Result is estimated due to high surrogate recovery.
3	Result(s) and RL(s) are estimated due to low matrix spike recovery.
4	Result is estimated due to high matrix spike recovery.
5	Result and RL are estimated due to low continuing calibration standard criteria failure.
6	Result is estimated due to high continuing calibration standard criteria failure.
7	Result(s) and RL(s) are estimated due to poor precision.
8	Result(s) and RL(s) are estimated due to low recovery of batch QC.
9	Result outside QC acceptance criteria.
A	Value reported is the mean of two or more determinations.
C	Value calculated from other independent parameters.
D	Analyte value quantified from a dilution(s); reporting limit (RL) raised.
E	Result is estimated due to high recovery of batch QC.
F	Amenable cyanide was not analyzed due to low level of total cyanide.
G	Result and RL are estimated due to initial calibration standard criteria failure.
H	Recommended laboratory holding time was exceeded.
I	Dilution required due to matrix interference; reporting limit (RL) raised.
J	Analyte was positively identified. Value is an estimate.
JA	Result is estimated due to multiple Aroclors present.
JC	Result is estimated since confirmation analysis did not meet acceptance criteria
JD	Due to severe degradation, specific Aroclor identification is difficult and quantitation is estimated.
K	RL(s) raised due to matrix interferences.
KR	RL(s) raised due to low sample volume submitted.
KS	RL(s) raised due to low total solids.
KW	RL(s) raised due to light sample weight.
LB	Reported library search compounds are tentative identifications with estimated concentrations.
M	The level of the method preparation blank (MPB) is reported in the qualifier column.
N	Non-homogeneous sample made analysis of sample questionable.
O	Result and RL estimated due to analysis from an open vial.
P	Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
PI	Possible interference may have affected the accuracy of the laboratory result
Q	Quantity of sample insufficient to perform analyses requested.
R	Result confirmed by re-extraction and analysis.
S	Supernatant analyzed.
T	Reported value is less than the reporting limit (RL). Result is estimated.
V	Value not available due to dilution.
W	Reported value is less than the method detection limit (MDL).
X	Methods 8260 & 624 are used to analyze volatile organics that have boiling points below 200°C. 2-Methylnaphthalene & naphthalene have boiling points above 200°C and are better suited to analysis by methods 8270 or 625 as semivolatile organics.
Z	Result reported below the RL to meet the TDL in RRD Op Memo 2 (10/22/04) multiplied by applicable dilution factor.

Re: *DDOT Schaefer Hwy Bus Depot - **DRAFT***

Dear Mr. Bah-Deh,

Gannett Fleming of Michigan, Inc. (Gannett Fleming) was tasked by the Michigan Department of Environmental Quality – Remediation & Redevelopment Division (MDEQ-RRD) to complete sub-slab soil gas probe installation and sampling at the City of Detroit-DOT property, located at 14044 Schaefer Highway in Detroit, Wayne County, Michigan (Figure 1). This Technical Memorandum provides a summary of previous work completed at the Site, a description of the investigation activities conducted in March 2013, and the results of these activities.

Sub-Slab Probe Installation and Sampling

On March 12, 2013, Gannett Fleming installed five sub-slab sampling points at the Site, three along the inside of the north garage building wall and two along the inside of the west building wall. These were installed to determine whether residual contaminants in soil could pose an indoor air inhalation risk to users of the building. The sub-slab sampling was conducted in general accordance with the MDEQ's *Draft - Guidance Document for the Vapor Intrusion Pathway*, May 2012, submitted to and approved by the MDEQ. The locations of the sampling points are depicted on Figure 2.

The sub-slab sampling points were installed directly below the concrete slab with a 3 inch screened interval. The borehole was drilled using a hand held rotary hammer drill with a 1 inch diameter drill bit. When the implant was installed, a 1 inch diameter stopper plug was used to seal the screened interval from the surface. Grout was used around the outside of the stopper plug to ensure a good seal. The implant was covered with a cone until sampling. After sampling, the sub-slab probes were removed and the concrete was repaired to its original condition.

Gannett Fleming collected all five sub-slab soil gas samples from the newly installed sampling

www.gannettfleming.com

points on March 14, 2013. Prior to sampling, three volumes of air were purged from the point using a 30cc syringe connected to a three-way valve. A valve and tubing system was affixed to the implant and connected to a pass through valve on a plastic "dome" that was sealed to the floor and filled with helium, to be used as a tracer compound. The helium was inserted into the dome through a separate valve mechanism. If no helium was detected in the tubing during the pre-sampling test, the soil gas sample would then be collected.

Soil gas samples were collected with laboratory supplied amber glass bottles equipped with a pressure gauge and regulator. The sample train was removed and the sampling bottle was connected directly to the sampling point with a section of polyethylene tubing. Sampling was completed when the pressure gauge read 0.0 inches of mercury (in Hg). After each sample was collected, the air inside the sample train was purged for at least five minutes using a small pump. This was done in an attempt to reduce the possibility of cross contamination between samples. The soil gas samples were delivered to the MDEQ Laboratory, located in Lansing, Michigan (MDEQ Laboratory) following Gannett Fleming's chain-of-custody protocol and analyzed for volatile organic compounds (VOCs) using USEPA Method TO-15 modified.

Sub-Slab Soil Gas Sampling Results

Soil gas sampling results were compared to Sub-Slab Industrial Acceptable Soil Gas Screening Concentrations, summarized in the MDEQ's *Draft Operational Memo No. 4 Attachment 4*, dated June 2008. This memo is still under review and criteria are used as reference only. Various petroleum and chlorinated VOCs were detected above laboratory detection limits in all five soil gas samples, in both field blank samples, and in the duplicate sample; however none exceeded the applicable draft criteria. One sample from SGP-2 contained benzene concentrations equal to the RBSL. Both field blank samples contained VOC contaminants, this suggests that the samples were most likely cross contaminated. Gannett Fleming personnel used the same tubing that was connected to the helium chamber for each sample as opposed to using new tubing for each sample. The helium chamber and the tubing connected to it, should have been used for leak detection purposes only and not during the actual sample collection. Analytical results are summarized in Table 1 and the original laboratory reports are included in Attachment A.

Conclusions

Four of the five sampling points contained VOC contaminants at generally low concentrations. Contaminants found in the sample from SGP-2 were much higher in concentration than the other four sampling points. SGP-2 was purposely sampled last, because during the probe installation, Gannett Fleming personnel could smell an unpleasant odor coming from the hole where SGP-2 was installed.

April 11, 2013
Mr. Pewu Bah-Deh
Page 3 of 3

In an effort to correct the mistake with the helium chamber apparatus and cross contamination issues, Gannett Fleming met with MDEQ staff to review the proper procedures for using the helium dome apparatus.

Please contact me at (734) 459-6955 if you have any questions or require additional information.

Sincerely,
GANNETT FLEMING OF MICHIGAN, INC.

<u>Qualifier Code</u>	<u>Qualifier Description</u>
1	Result(s) and RL(s) are estimated due to low surrogate recovery.
2	Result is estimated due to high surrogate recovery.
3	Result(s) and RL(s) are estimated due to low matrix spike recovery.
4	Result is estimated due to high matrix spike recovery.
5	Result and RL are estimated due to low continuing calibration standard criteria failure.
6	Result is estimated due to high continuing calibration standard criteria failure.
7	Result(s) and RL(s) are estimated due to poor precision.
8	Result(s) and RL(s) are estimated due to low recovery of batch QC.
9	Result outside QC acceptance criteria.
A	Value reported is the mean of two or more determinations.
C	Value calculated from other independent parameters.
D	Analyte value quantified from a dilution(s); reporting limit (RL) raised.
E	Result is estimated due to high recovery of batch QC.
F	Amenable cyanide was not analyzed due to low level of total cyanide.
G	Result and RL are estimated due to initial calibration standard criteria failure.
H	Recommended laboratory holding time was exceeded.
I	Dilution required due to matrix interference; reporting limit (RL) raised.
J	Analyte was positively identified. Value is an estimate.
JA	Result is estimated due to multiple Aroclors present.
JC	Result is estimated since confirmation analysis did not meet acceptance criteria
JD	Due to severe degradation, specific Aroclor identification is difficult and quantitation is estimated.
K	RL(s) raised due to matrix interferences.
KR	RL(s) raised due to low sample volume submitted.
KS	RL(s) raised due to low total solids.
KW	RL(s) raised due to light sample weight.
LB	Reported library search compounds are tentative identifications with estimated concentrations.
M	The level of the method preparation blank (MPB) is reported in the qualifier column.
N	Non-homogeneous sample made analysis of sample questionable.
O	Result and RL estimated due to analysis from an open vial.
P	Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
PI	Possible interference may have affected the accuracy of the laboratory result
Q	Quantity of sample insufficient to perform analyses requested.
R	Result confirmed by re-extraction and analysis.
S	Supernatant analyzed.
T	Reported value is less than the reporting limit (RL). Result is estimated.
V	Value not available due to dilution.
W	Reported value is less than the method detection limit (MDL).
X	Methods 8260 & 624 are used to analyze volatile organics that have boiling points below 200°C. 2-Methylnaphthalene & naphthalene have boiling points above 200°C and are better suited to analysis by methods 8270 or 625 as semivolatile organics.
Z	Result reported below the RL to meet the TDL in RRD Op Memo 2 (10/22/04) multiplied by applicable dilution factor.

Re: *Sub-Slab Soil Vapor Assessment*
Terminal Building, DDOT Schaefer Hwy Bus Depot

Dear Mr. Scheels,

Gannett Fleming of Michigan, Inc. (Gannett Fleming) was authorized by the Michigan Department of Environmental Quality – Remediation & Redevelopment Division (MDEQ-RRD) to complete sub-slab soil vapor probe installation and sampling in the Terminal Building at the City of Detroit-DOT property, 14044 Schaefer Highway, Detroit, Wayne County, Michigan (Figure 1). This Technical Memorandum provides a description of the investigation activities conducted in November 2013 under this authorization, and presents the results of these activities and our recommendations for additional work.

Sub-Slab Probe Installation and Sampling

On November 25, 2013, Gannett Fleming installed six sub-slab soil vapor probes in the basement of the Terminal Building, located at the northwest corner of the site. The samples were to be collected from the floor of a basement sub-level located under the southeast corner of the Terminal Building (Figure 2). The purpose of the investigation was to determine whether residual contaminants in soil or groundwater under the building could pose an indoor air inhalation risk to users of the building.

The sub-slab sampling was conducted in general accordance with the MDEQ's *Guidance Document for the Vapor Intrusion Pathway*, May 2013, and Gannett Fleming's Work Plan Letter, submitted to the MDEQ on October 10, 2013, and approved the same day

Mr. Josh Scheels

Page 2 of 4

The locations for the sub-slab sampling points were selected during a site visit on November 15, 2013, and marked for later installation using orange utility marking spray paint. On November 25, 2013, six vapor sampling points were installed directly into the concrete slab of the basement floor. Borings were drilled through the floor using a hand held rotary hammer drill with a 1.5 inch and 5/8 inch diameter drill bit. First, the 1.5 inch borehole was drilled about 1.75 inches into the concrete slab, then the 5/8 inch borehole was installed through the initial boring and through the concrete slab. The 5/8 inch bit was allowed to penetrate approximately 1 to 2 inches below the concrete into the sub-slab to create a void. A Vapor Pin®, developed by Cox and Colvin, was then pushed into the borehole, and a protective cover threaded onto the vapor pin until sampling could be completed. The vapor pin fits tightly into the boring and provides an air-tight seal so that vapors can only pass through the pin, and not the annulus of the drilled borehole.

Gannett Fleming returned to the site on November 26, 2013, to collect the sub-slab soil vapor samples. However, on inspection of the points, it became apparent that water directly beneath the basement slab was under pressure, and this water rose up into several of the sampling pins, preventing collection of vapor samples. Five points, SGP-1, 2, 3, 5 and 6 could not be sampled for sub-slab soil vapors due to the presence of water in the sampling points. In some sample points, water was under sufficient pressure that it exited through the pins and flowed onto the basement floor. Only one of the soil vapor probes, SGP-4, was not full of water. The locations of the sampling points are depicted on Figure 3.

Gannett Fleming attempted to collect a sample at SGP-4. Prior to sampling, three volumes of air were purged from the vapor pins using a 30cc syringe connected to a three-way valve. A valve and tubing/regulator system was affixed to the pin and connected to a pass through valve on a plastic "dome" that was sealed to the floor and filled with helium. The helium was inserted into the dome through a separate valve mechanism. The helium is used as a tracer compound to ensure there are no leaks in the sampling train. If no helium is detected in the sampling train during the pre-sampling test, the tracer apparatus is removed and the sampling train connected to the sampling vacuum bottle.

A laboratory supplied amber glass vacuum bottle equipped with a pressure gauge and regulator was used as the sample collection vessel. The sample train was connected directly to the vacuum bottle using a quick connector. When the valve on the regulator was opened to the vacuum bottle, the initial negative pressure (vacuum) on the

December 23, 2013

Mr. Josh Scheels

Page 3 of 4

pressure gauge read 29 inches of mercury. After about 30 minutes, the pressure had not changed, indicating that the porosity of the sub-slab materials was insufficient to allow vapors to move from the sub-slab into the vacuum bottle under the 29 inches of mercury vacuum. This low porosity is most likely due to the presence of tight clay immediately below the concrete, or water filling the soil pores immediately beneath the concrete slab, causing a “hydraulic block” to gas movement.

Because no sub-slab samples could be collected, it was decided to collect an ambient air sample adjacent to the basement sump. The ambient air sample was delivered to the MDEQ Laboratory in Lansing, Michigan (MDEQ Laboratory) following Gannett Fleming’s chain-of-custody protocol and analyzed for volatile organic compounds (VOCs) using USEPA Method TO-15, modified.

Sub-Slab Soil Vapor Sampling Results

The ambient air sampling results were compared to Non-Residential (Chronic) Indoor Air Screening Values, summarized in Appendix D.2 (Draft) of the MDEQ’s *Guidance Document for the Vapor Intrusion Pathway*, May 2013. Various petroleum-related VOCs were detected above laboratory detection limits in the ambient air sample; however none exceeded the applicable draft criteria. Analytical results are summarized in Table 1 and the original laboratory report is included in Attachment A.

Water Sampling

During the November 15, 2013, site visit, a dark viscous material appearing like weathered oil was observed floating on the surface of the water contained in the sump of the basement. A water sample was collected from the basement sump below the dark material to evaluate whether it contained petroleum hydrocarbons. Prior to sampling the sump water, an oil water interface probe was used to measure the thickness of the dark layer of material on the surface of the sump water. The material was approximately 0.02 inches thick. A peristaltic pump was used to collect a grab sample of the sump water from several inches below the water interface with the oil-like material. The water sample was placed directly into laboratory supplied sample containers and submitted to the MDEQ Laboratory. The water sample was analyzed for VOCs by USEPA Solid Waste SW-846 Method 8260. A copy of the laboratory report is included in Attachment A.

Only one compound was detected above the laboratory detection limit in the water sample collected from the basement sump. The water sample contained 1,2,4-

December 23, 2013

Mr. Josh Scheels

Page 4 of 4

trimethylbenzene at a concentration of 1.1 µg/L. No other compounds were detected above the laboratory detection limit and no compounds were detected above any applicable RBSL.

Conclusions

Due to tight clays and the presence of water directly beneath the concrete slab of the basement, no sub-slab soil vapor samples were able to be collected from the Terminal Building. One ambient air sample and one water sample from the sump were collected in the basement of the Terminal Building in lieu of sub-slab vapor samples. Both samples contained VOCs at low concentrations below any applicable RBSLs. The subgrade lithology of clay and the presence of a saturated soil zone below the slab would make it unlikely for sub-slab vapors to penetrate and migrate into the basement floor of the Terminal Building. The footer sub-drain and the sump, however could pose an entry point if the footer area came into contact with contaminants.

Based on the analytical data collected and field observations at the site, Gannett Fleming recommends that no further action is necessary for investigating whether residual contaminants in soil or groundwater pose a continuing indoor air inhalation risk to users of the building.

Please contact me at (734) 459-6955 if you have any questions or require additional information.

Sincerely,

GANNETT FLEMING OF MICHIGAN, INC.

Bah-Deh, Pewu (DEQ)

From: Savage, Craig A. [csavage@GFNET.com]
Sent: Tuesday, May 01, 2012 10:02 AM
To: Bah-Deh, Pewu (DEQ)
Subject: Draft results for Detroit DDOT Schaefer Highway
Attachments: Soil Table AS.pdf; Groundwater Table AS.pdf; 54910 fig4 Model (1).pdf - Adobe Acrobat Professional.pdf

Hello Pewu,

We are working on the RI/FS report for the DDOT Bus Depot on Schaefer Hwy., but I wanted to get you some information in the interim. Attached are draft copies of soil analytical tables, groundwater analytical tables and a map showing sampling locations. Most contamination identified on the site was shallow, and especially near the north UST area, the contaminants appeared to be related to surface spills that had entered cracks in the concrete and spread laterally along the underside of the concrete slab. There is a significant clay at about 4 feet that seems to have stopped vertical migration of contaminants into the deeper soils, and most is contained in the shallow fill.

I'll be in your office today meeting with Jeanne Schlaufman from 12-1:30 about a site in New Boston, MI, so track me down if you want to discuss anything. Otherwise, please take a look at the data and I'll set up a separate time for us to talk about options to include in the FS. Thanks.

ug/L = micrograms per liter
 RL = Reporting Limit
 GS = Grab Sample
 NA = Not Applicable
 S = Result and RL are estimated due to low continuing calibration standard criteria failure.
 D = Analyte value quantified from a dilution(s); RL raised.
 J = Analyte was positively identified. Value is an estimate.
 P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
 T = Reported value is less than the reporting limit (RL). Result is estimated.
 X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.
 Bolded indicates concentration exceeds laboratory method detection limit.
 Shaded indicates concentration exceeds one or more applicable RBSL.
 Analytical results are only shown for analytes that were detected.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

S = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s), RL raised.

I = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Italic indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

ug/L = micrograms per liter
 RL = Reporting Limit
 GS = Grab Sample
 NA = Not Applicable
 S = Result and RL are estimated due to low continuing calibration standard criteria failure.
 D = Analyte value quantified from a dilution(s); RL missed.
 J = Analyte was positively identified. Value is an estimate.
 P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
 T = Reported value is less than the reporting limit (RL). Result is estimated.
 X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.
 Bolded indicates concentration exceeds laboratory method detection limit.
 Shaded indicates concentration exceeds one or more applicable RBSL.
 Analytical results are only shown for analytes that were detected.

All Soil Concentrations Are Expressed in Units of ug/kg And Groundwater Concentrations in Units Of ug/L. Values Shown Are Those in Exceedence of Applicable Part 213 Tier 1 Risk Based Screening Levels (RBSLs).

Samples Were Collected in March 2012.

SITE SYNOPSIS

DISTRICT QRT DATE: March 4, 2011
ACCOUNTING CODE: 44703

Site Name: Detroit Department of Transportation-Coolidge Facility
Address: 14044 Schaefer Hwy, Detroit
County: **Wayne**; Type: **Commercial**; Funding: **PRP?**
Part 213 Facility ID: 13464; 213 Site Class: 1;
Release #s: C-1332-99, C-1333-99, C-1388-99 & C-88-00

Project Manager/Presenter: Pewu Bah-deh
General Program Topic: Final Assessment Report(FAR)

Subsequent Peer Review Expected: Yes

Site Background, Summary, & Recommendations:

The site is owned by City of Detroit and it is used as City Bus Depot. The site is located in a mixed residential and commercial neighborhood. It is bounded by Schaefer on the West, Schoolcraft on the south, Lyndon on the north and Cheyenne on the east.

This facility has four (4) confirmed releases that were discovered during USTs removals and basic site investigations during 1999 and 2000. Free product was discovered in an on-site monitoring well (MW-15) during a GW monitoring event. The plumes at the site appear to be commingled. As of April 2003, when site activities stopped, a total of 6,260 cubic yards of impacted soil, 2,800 gallons, of impacted GW, and 1.9 gallons of free product had been removed and disposed of. A total of 19 USTs were removed in January 2000 but six USTs are still in used at the site.

GW & soil Contaminant concentrations (BTEX, TMBs, and PNAs) off-site exceed residential screening levels; and the on-site impacts exceed Commercial III risk-base screening levels. Off-site impacted property owners have not been notified of the migration onto their properties.

The following recommendations are made in order to address the contamination at the site.

RECOMMENDATION:

- Test the on-site monitoring wells to determine the present/absence of free product (MW-7, MW-10, MW-11, MW-12, MW-13, MW-14, and MW-15). *Please see attached Site Sketch Map.*
- As an interim-measure, and to stop, or minimize further migration of the plumes, source removal should be conducted.
- Subsurface investigation is needed to determine if underground utilities are aiding fate & transport.
- Complete the delineation of the soil & GW plumes, especially to the north of the site.
- The August 29, 2003 FAR suggests a Bioremediation Alternative; however, it is necessary to conduct further investigation/site characterization to generate current data upon which an appropriate alternative corrective action will be based.
- Upon completion of the contaminant delineation, an appropriate corrective action should be undertaken to remedy the acute risks at the site.
- Residual contamination that will remain at the site should not exceed Commercial Land Use risk-based screening levels.
- The City of Detroit should assist the RD/Consultant to obtain off-site access to the off-site impacted properties.

SUBJECT: Professional Firm to Perform Remedial Investigation/Feasibility Study at City of Detroit Department of Transportation, Site ID #: 82002470, Wayne County

The professional services of Gannett Fleming of Michigan, Inc. are requested between July 2011 and November 2012 to conduct remedial investigation and feasibility study at the above referenced project. The estimated contractual amount is \$150,000.00.

I have evaluated the suitability of this firm to conduct the described work and recommend them based upon the lack of conflict of interest and availability of staff and resources. The Professional Firm's written response to my conflict of interest inquiry is attached.

A Statement of Objectives for the project has been prepared and is also attached.

The funding source is Refined Petroleum Fund. Funding has been requested in ERNIE.

SITE SUMMARY

Site Name	City of Detroit - DOT - 14044 Schaefer	County	Wayne
Street Address	14044 Schaefer Avenue	DEQ District	Southeast MI
City	Detroit	Legislative Districts	
Site ID#	82002470	MI Senate	003
SID Facility ID	00013464	MI House	011
		US Congress	015

LOCATION

This site is located on the Northwest side of Detroit on Schaefer, just north of Schoolcraft Street. There is a salvage yard west of the site, across Schaefer. The rest of the surrounding is mostly small commercial businesses.

SITE HISTORY (Response Activities Undertaken to Date)

This site has operated as a city of Detroit Department of Transportation facility for unknown number of years. It is historically owned and managed by the city of Detroit, Department of Public Works. The site is zoned commercial and is surrounding by small commercial business establishments.

The underground storage tanks (USTs) at the site were installed between 1946 through February 2001. Of the total 24 USTs installed, 18 were either removed or closed-in-place from December 1999 to January 2000. Contents of the removed USTs included dextron, converter/oil, engine oil, used oil, gasoline, diesel, and water. The remaining six USTs are used to store diesel, gasoline, and used oil. The capacities of the 24 USTs ranged from 500 gallons to 50,000 gallons.

A total of four confirmed releases have been reported for the site (3 in 1999 and 1 in 2000). The products released consisted of diesel, gasoline, and engine oil. In 2000 a diesel transfer pipe failed and resulted in a significant release of product near the building which caused the evacuation of the building. In addition to these releases, free product was discovered in MW-15 in April 2003.

Prior to the 2000 release, 2,540 cubic yards of impacted soil and 2,800 gallons of contaminated groundwater were excavated and disposed of during USTs removal. A total of 272 gallons of free product was also recovered. The limited investigation conducted at the site indicate that 24 temporary wells and nine permanent monitor wells were installed. Soil data from some of the 24 soil borings installed, indicate that the contamination has migrated off-site, therefore, a Notice of Off-Site Migration was filed with the DEQ.

Reports submitted to the DEQ to date include an Initial Assessment Report, a Final Assessment Report, and two Free Product Status Reports. The site is currently considered out of compliance with Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environmental Response Act, Act 451 of 1994, as amended. The city of Detroit has not conducted any response actions since 2003. The city has been determined to be a non-viable liable party.

SITE STATUS (Risks Requiring Action)

Extensive free product is present at the site and the extent is not defined. Overall, the extent of soil contamination has not been defined. Additional remedial investigations are needed to determine the risks posed by the free product and heavily impacted soils to off-site properties. Assessment of the vapor intrusion pathway is needed.

An LOE has been retained to conduct the remedial investigations and feasibility study. To date, site access has been obtained, and soil borings have been conducted. Soil and groundwater samples were submitted to labs and the resulting analytical data shows elevated levels of volatiles and PNAs. DRO and GRO concentrations were in the order of 500,000 and 3,500,000 respectively. LOE is currently preparing the Remedial Investigation/Feasibility Report.

STATE FUNDS ALLOCATED FOR CLEANUP ACTIVITIES*: \$150,000.00

*State funds are set aside to complete activities at this site but may not be expended.

**RE: Request for Right-of-Entry - DDOT Coolidge Bus Depot
14004 Schaefer (Ward 22/Item 029852)
Detroit, Michigan 48227**

Dear Mr. Owens:

You have requested a right-of-entry to conduct oversight of the authorized activities at the above-referenced address (hereinafter, the "Site") to be conducted by Gannett Fleming of Michigan, Inc., on behalf of the Michigan Department of Environmental Quality, as part of the Refined Petroleum Funding initiative.

Please be advised that the City of Detroit grants permission to the Michigan Department of Environmental Quality ("MDEQ") to enter the above referenced Site for the sole purpose of conducting the oversight activities described in **Exhibit A**. The City of Detroit makes no representation or warranty as to the status of title or the physical and/or environmental conditions of the Site, and access is at MDEQ's own and sole risk. This Right-of-Entry shall automatically terminate upon the completion of the work described herein, or on December 31, 2012, whichever occurs first. The City requests that MDEQ provide, without charge, any and all data, analytical results, work plans, reports, documents, or other media generated in connection with the activities.

This Right-of-Entry will be effective only upon execution of the acknowledgment and agreement noted herein by an authorized representative of MDEQ and upon delivery of same to Mr. Raymond A. Scott of the Buildings, Safety Engineering and Environmental Department.

Sincerely,

A handwritten signature in cursive script that reads "Lovevett Williams". The signature is written over a horizontal line.

Lovevett Williams
Director, Detroit Department of Transportation

Michigan Department of Environmental Quality, by its duly authorized representative, hereby acknowledges receipt of the original copy of this letter, and agrees to be bound by the terms and conditions stated herein.

SCOPE OF WORK

The following is the scope of work that the Michigan Department of Environmental Quality ("MDEQ") is authorized to perform at the Site. MDEQ shall be responsible for ensuring compliance in all respects with the Scope of Work, and all applicable Federal, State, and local laws, rules, regulations, ordinances and orders.

MDEQ is only authorized to undertake the following activity at the Site:

1. conduct oversight of the authorized activities to be performed by Gannett Fleming of Michigan, Inc. at 14044 Schaefer, under their City of Detroit Right-of-Entry dated January 25, 2012, incorporated in full by reference.

Discretionary Contract #8010; Mod #15.0
City of Detroit - DOT - 14044 Schaefer; Site ID #82002470

Please process the attached contract modification request to add the City of Detroit - DOT - 14044 Schaefer project of the Gannett Fleming of Michigan, Inc. LOE Contract. The work conducted under this modification is a remedial investigation, as described in more detail in the attached work plan, and will cost \$66,048.16. The project period is 10/7/11 through 5/31/12. Remediation Division staff has reviewed this request and recommends that it is approved. Attached are three signed originals for processing.

If you have any questions contact me at 517-373-2811. Thank you for your assistance.

Re: *DDOT Schaefer Hwy Bus Depot - DRAFT*

Dear Mr. Bah-Deh,

Gannett Fleming of Michigan, Inc. (Gannett Fleming) was tasked by the Michigan Department of Environmental Quality – Remediation & Redevelopment Division (MDEQ-RRD) to complete sub-slab soil gas probe installation and sampling at the City of Detroit-DOT property, located at 14044 Schafer Highway in Detroit, Wayne County, Michigan (Figure 1). This Technical Memorandum provides a summary of previous work completed at the Site, a description of the investigation activities conducted in March 2013, and the results of these activities.

Sub-Slab Probe Installation and Sampling

On March 12, 2013, Gannett Fleming installed five sub-slab sampling points at the Site, three along the inside of the north garage building wall and two along the inside of the west building wall. These were installed to determine whether residual contaminants in soil could pose an indoor air inhalation risk to users of the building. The sub-slab sampling was conducted in general accordance with the MDEQ's *Draft - Guidance Document for the Vapor Intrusion Pathway*, May 2012, submitted to and approved by the MDEQ. The locations of the sampling points are depicted on Figure 2.

The sub-slab sampling points were installed directly below the concrete slab with a 3 inch screened interval. The borehole was drilled using a hand held rotary hammer drill with a 1 inch diameter drill bit. When the implant was installed, a 1 inch diameter stopper plug was used to seal the screened interval from the surface. Grout was used around the outside of the stopper plug to ensure a good seal. The implant was covered with a cone until sampling. After sampling, the sub-slab probes were removed and the concrete was repaired to its original condition.

Gannett Fleming collected all five sub-slab soil gas samples from the newly installed sampling

points on March 14, 2013. Prior to sampling, three volumes of air were purged from the point using a 30cc syringe connected to a three-way valve. A valve and tubing system was affixed to the implant and connected to a pass through valve on a plastic "dome" that was sealed to the floor and filled with helium, to be used as a tracer compound. The helium was inserted into the dome through a separate valve mechanism. If no helium was detected in the tubing during the pre-sampling test, the soil gas sample would then be collected.

Soil gas samples were collected with laboratory supplied amber glass bottles equipped with a pressure gauge and regulator. The sample train was removed and the sampling bottle was connected directly to the sampling point with a section of polyethylene tubing. Sampling was completed when the pressure gauge read 0.0 inches of mercury (in Hg). After each sample was collected, the air inside the sample train was purged for at least five minutes using a small pump. This was done in an attempt to reduce the possibility of cross contamination between samples. The soil gas samples were delivered to the MDEQ Laboratory, located in Lansing, Michigan (MDEQ Laboratory) following Gannett Fleming's chain-of-custody protocol and analyzed for volatile organic compounds (VOCs) using USEPA Method TO-15 modified.

Sub-Slab Soil Gas Sampling Results

Soil gas sampling results were compared to Sub-Slab Industrial Acceptable Soil Gas Screening Concentrations, summarized in the MDEQ's *Draft Operational Memo No. 4 Attachment 4*, dated June 2008. This memo is still under review and criteria are used as reference only. Various petroleum and chlorinated VOCs were detected above laboratory detection limits in all five soil gas samples, in both field blank samples, and in the duplicate sample; however none exceeded the applicable draft criteria. One sample from SGP-2 contained benzene concentrations equal to the RBSL. Both field blank samples contained VOC contaminants, this suggests that the samples were most likely cross contaminated. Gannett Fleming personnel used the same tubing that was connected to the helium chamber for each sample as opposed to using new tubing for each sample. The helium chamber and the tubing connected to it, should have been used for leak detection purposes only and not during the actual sample collection. Analytical results are summarized in Table 1 and the original laboratory reports are included in Attachment A.

Conclusions

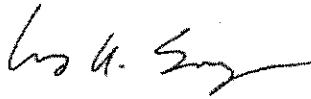

Four of the five sampling points contained VOC contaminants at generally low concentrations. Contaminants found in the sample from SGP-2 were much higher in concentration than the other four sampling points. SGP-2 was purposely sampled last, because during the probe installation, Gannett Fleming personnel could smell an unpleasant odor coming from the hole where SGP-2 was installed.

April 11, 2013
Mr. Pewu Bah-Deh
Page 3 of 3

In an effort to correct the mistake with the helium chamber apparatus and cross contamination issues, Gannett Fleming met with MDEQ staff to review the proper procedures for using the helium dome apparatus.

Please contact me at (734) 459-6955 if you have any questions or require additional information.

Sincerely,
GANNETT FLEMING OF MICHIGAN, INC.

1.0 INTRODUCTION

The Michigan Department of Environmental Quality (MDEQ) retained Gannett Fleming of Michigan Inc. (Gannett Fleming) to conduct a limited subsurface investigation and evaluate remedial options to address contamination at the City of Detroit-DOT property, located at 14044 Schafer Highway in Detroit, Wayne County, Michigan (Figure 1). Due to recent financial hardship, the City of Detroit cannot conduct remedial activities and has been deemed a non-viable liable party. The State of Michigan has opted to take over the site characterization and remedial action at the site and has authorized Gannett Fleming to conduct remedial activities under the Level of Effort contract mechanism. This work was authorized by the Michigan Department of Technology, management & Budget under Purchase Order 761P2200040, dated October 7, 2011.

1.1 Site Background and Description

The City of Detroit – DOT property (also known as the Coolidge Terminal Facility) was operated as a bus storage and maintenance depot by the Detroit Department of Transportation (DDOT) as recently as January 2012. The site has been inactive since January 2012 to facilitate upgrades and modifications to the terminal. The property has operated as a bus terminal since at least the mid-1940's. Features of the site at the time of this investigation include a 150,000 square foot (approx.) main building used for fueling, storage, cleaning and service/maintenance of DDOT buses, and several smaller out-buildings including an administrative building, a fare box storage building, and a boiler/heating plant building. The remainder of the site is mostly paved with concrete or asphalt (Figure 2).

The area around the site is zoned for commercial and residential uses. Adjacent properties include a salvage yard to the west (across Schaefer Highway), a trucking / shipping company to the north, and residential properties to the south and east.

1.2 Underground Storage Tank Status

According to information provided by the MDEQ, 17 underground storage tanks (USTs) were installed at the site in 1946 and two more were installed in 1979-80. These USTs ranged in size from 500 to 50,000 gallons and contained various liquids, including

diesel fuel, gasoline, engine oil, convertor oil, Dexron (transmission fluid), used oil, and water. All of these tanks were removed or closed-in-place in late 1999 and early 2000.

Six new USTs were installed at the site in 2001 to replace those removed the previous year. These USTs are still in use, and include four 25,000-gallon diesel tanks, one 10,000-gallon gasoline tank and one 1,000 gallon used oil tank.

1.3 Release History and Corrective Actions

Five confirmed releases are on file for the site: three confirmed releases were reported in December 1999, one was reported in January 2000, and the last was reported in September 2006. The 1999 release were identified during construction activities around the USTs and involved several oil, diesel and gasoline tanks. The 2000 release occurred when a diesel transfer pipe failed near the northwest portion of the garage/service building, resulting in an emergency evacuation of personnel from the building. The 2006 release was related to a leaking diesel fuel clamp. No response activities are known to have been performed in response to the 2006 release. The volumes of these releases are unknown.

Interim response and site investigation activities were conducted at the site by The Traverse Group from 1999 through 2003. During the course of these investigations, 41 soil borings were advanced, seven temporary monitoring wells were installed, and 9 permanent monitoring wells were installed. Soil sample and groundwater data from these investigations indicated that contamination had migrated off-site to the property immediately north of and adjacent to the former USTs. In April 2003, petroleum free-product, or light non-aqueous phase liquid (LNAPL), was observed in monitoring well MW-15, located directly north of the main building, near the former fuel pump house, and at the northern property line. LNAPL thickness was monitored for six months, and in ten monitoring events, never exceeded 2.76 inches. Monitoring was terminated after October 2003, when product thickness had dropped to 0.24 inches. Six other monitoring wells were included in the LNAPL monitoring events, but LNAPL was only observed in MW-15.

These investigations conducted by the Traverse Group were summarized in the following reports:

- Initial Assessment Report (IAR) (March 20, 2000)

- Final Assessment Report (FAR) (December 31, 2001).
- Amended Final Assessment Report (AFAR) (August 29, 2003)
- Free Product Status Recovery Report (July 14, 2003)
- Free Product Status Recovery Report (October 19, 2003)

Based on information in the AFAR, 6,260 cubic yards of contaminated soil was removed during various site activities, including the closure of the former USTs and installation of the new USTs and communications line. This soil was disposed at the Waste Management Woodland Meadows facility, in Wayne, Michigan. In addition, 2,800 gallons of impacted groundwater and (estimated) 272 gallons of LNAPL were collected from the excavation pits and disposed off site.

The City of Detroit has not conducted any response activities since 2003. In 2008, the Traverse Group voluntarily waived its status as a Qualified UST Consultant, and is no longer involved with the remedial activities. According to MDEQ file notes, a Notice of Off-Site Migration was prepared and submitted to the property owner, but this could not be confirmed from information reviewed for this report.

2.0 OBJECTIVES

The primary objectives of the work at the site were determined during several meetings and communications with the MDEQ. These objectives are summarized below:

- Determine the nature and extent of soil and groundwater contamination at the site.
- Determine the present location of light non-aqueous phase liquid (LNAPL, or free product), if present, at the site.
- Assess the potential for and risk due to vapor intrusion into the on-site main building.
- Identify alternatives for remediating the LNAPL source area and the soil and groundwater contamination at the site.

During a September 21, 2011 meeting with the MDEQ, it was agreed that the initial phase of work would be limited to on-site activities, and that off-site investigations would occur at a later time, as necessary.

3.0 SUMMARY OF INVESTIGATION ACTIVITIES

3.1 Geophysical Survey

On January 27, 2012, Fibertec Environmental Services (Fibertec) conducted a geophysical survey using ground penetrating radar (GPR) and electromagnetic (EM) induction. This survey was performed in areas where subsurface investigations were to be conducted to locate underground utilities not marked by the MISS-DIG one-call system and to identify locations of USTs, both active USTs and closed-in-place. The GPR produced mixed results in attempts to identifying some utilities on site due to heavy rains producing puddles and saturated soil conditions the day prior to the survey. However, the GPR equipment was able to easily identify the existing and closed in place USTs. The EM survey was more successful at identifying the communications line and other small diameter piping and cable runs within the study. These subsurface features were marked using non-toxic paint so that they could be avoided during drilling.

3.2 Subsurface Investigation and Sampling

On January 30 through February 2, 2012, under supervision of Gannett Fleming personnel, Fibertec advanced 30 direct push soil borings (SB-1 through SB-30) (Figure 2). Ten borings, SB-1 through SB-10, were placed in the area near the southeast corner of the main building where three USTs were formerly located (former SE UST area). The other 20 borings, SB-11 through SB-30, were placed in the area north of the main building where the current USTs and most of the former USTs were located (North UST area). The former USTs in the SE UST area were closed and removed, while some of the former USTs in the North UST area were closed-in-place by filling with inert material.

Each soil boring was sampled continuously from the ground surface to the terminus of the boring using a five foot long by two inch diameter macro-core barrel equipped with disposable sample liners. Soil total depths of the soil borings ranged from 10 feet to 20 feet below ground surface (bgs). The core barrels were advanced in 5 foot intervals, after which they were removed and the soil was examined by the Gannett Fleming field geologist. Soil lithology, soil appearance and presence of staining, soil odors and photoionization detector (PID) readings, and other pertinent observations were recorded on soil boring logs. Soil lithology was described using the Unified Soil Classification System (USCS). Soil boring logs are presented in Appendix A.

Soil samples were obtained at two foot intervals along the entire vertical soil column and field-screened for the presence of volatile organic compounds using a PID calibrated to a 100 parts per million (ppm) isobutylene standard gas. PID screening results were used to provide qualitative relative comparisons of contaminants in soil between borings and depth intervals. PID results were also used to select the soil samples that would be submitted to the analytical laboratory for detailed analyses. The PID readings are included on the boring logs presented in Appendix A.

Where practicable, soil samples were collected for laboratory analysis from two intervals at each boring. One sample was generally collected from the interval that had the highest PID reading and a second sample from a deeper interval with a low PID reading to vertically delineate the extent of petroleum related constituents.

Groundwater samples were collected for laboratory analysis from temporary monitoring wells at soil boring locations that produced sufficient groundwater to collect a sample. Temporary monitoring wells were constructed of 1-inch PVC casing directly installed into the soil boring. Only three of the 30 soil borings, SB-5, SB-17 and SB-18, contained sufficient groundwater to warrant installation of temporary monitoring wells and collection of groundwater samples.

A total of 58 soil samples and 3 groundwater samples were collected from the 30 soil borings advanced during this phase of the subsurface investigation. All samples were submitted to the MDEQ Environmental Laboratory in Lansing, Michigan. All soil and groundwater samples collected were analyzed for BTEX, MTBE, and TMBs by USEPA Solid Waste SW-846 Method 8260; polynuclear aromatic hydrocarbons (PNAs) by USEPA SW-846 Method 8270; and lead by USEPA SW-846 Method 6020. One soil sample, SB-3 (2-4) was analyzed for diesel range organics and gasoline range organics by USEPA SW-846 Method 8015 and for TCLP VOCs and TCLP metals. All samples were placed on ice and delivered to the laboratory following Gannett Fleming's chain-of-custody protocol. Soil and groundwater analytical results for samples collected during soil boring advancement are summarized in Tables 1 and 2 and presented graphically on Figures 3 and 4. Copies of the laboratory reports are provided in Appendix B.

3.3 Soil Gas Probe Installation

Gannett Fleming originally planned on converting soil borings SB-28, SB-29 and SB-30 to soil gas sampling points to evaluate the volatilization to indoor air vapor inhalation pathway inside the main building. Sub-slab samples inside the main building were considered unfeasible due to the high levels of ambient VOC concentrations inside the maintenance/fueling areas. Therefore, soil gas probes outside the building foundation/footer, between the USTs and the building, were deemed a more practical approach to assess this pathway. During drilling, ubiquitous shallow (< 4 feet) thick clay was found beneath the site with somewhat more permeable fill above. This clay had a porosity too low to transmit vapors to the soil gas probes, and the overlying fill was too saturation with water to allow soil gas collection. Because of these geological conditions, the soil gas probes were considered impractical for their intended use and eliminated from the investigation plan. Soil samples were collected from the terminus (10 feet bgs) of these borings in lieu of gas samples. Boring logs and analytical results from SB-28 through SB-30 are summarized in Table 1 and Figure 3 and the laboratory reports are included as Appendix B.

3.4 Groundwater Sampling-February 2012

During the subsurface investigation Gannett Fleming personnel located 3 of the 4 existing on-site permanent monitoring wells at the site (Figure 2). Two wells (MW-2 and MW-3) were located east of the SE UST area, and one (MW-7) was located in the North UST area. MW-15, which was the focus of LNAPL monitoring from 2002 through 2003, was not found at the location shown on earlier maps. Groundwater samples were collected from MW-2, MW-3 and MW-7 on February 8, 2012 following low flow groundwater sampling procedures. A peristaltic pump and disposable tubing was used to purged groundwater in each well through a flow through cell where a YSI analyzer was used to monitor water temperature, pH, ORP dissolved oxygen and conductivity. Once these parameters were stabilized for three consecutive readings, the tubing was disconnected from the flow through cell and groundwater samples were placed directly into laboratory supplied sample containers.

The three on-site monitoring well groundwater samples were submitted to the MDEQ Laboratory and analyzed for BTEX, MTBE, and TMBs by USEPA Solid Waste SW-846 Method 8260; polynuclear aromatic hydrocarbons (PNAs) by USEPA SW-846 Method 8270; and lead by USEPA SW-846 Method 6020. All samples were placed on ice and

delivered to the laboratory following Gannett Fleming's chain-of-custody protocol. Groundwater analytical results from these monitoring well samples are summarized in Table 3 and presented graphically on Figure 4. Copies of the laboratory reports are provided in Appendix B.

3.5 Groundwater Sampling-August 2012

On August 17, 2012, after obtaining access to conduct investigation activities at the Frisbie Moving & Storage (Frisbie) property, Gannett Fleming personnel returned to the site to conduct follow-up groundwater and LNAPL monitoring activities at the DDOT property and the off-site Frisbie property. Field staff again attempted to locate MW-15 using an electromagnetic wand to detect the steel well cover. After extensive probing and searching, MW-15 still could not be found. The presence of relatively new concrete over the area where MW-15 was supposed to be located suggests that MW-15 may have been covered or destroyed during various site modifications since 2003.

The five off-site monitoring wells installed in 2002 (MW-10, MW-11, MW-12, MW-13, and MW-14) were located in the Frisbie Moving & Storage parking lot. These five wells and the three on-site wells (MW-2, MW-3 and MW-7) were sampled on August 17, 2012, following low flow groundwater sampling procedures, as described above. A peristaltic pump or bladder pump with disposable tubing was used to purged groundwater in each well and collect the samples

The eight monitoring well groundwater samples were submitted to the MDEQ Laboratory and analyzed for BTEX, MTBE, TMBs and polynuclear aromatic hydrocarbons (PNAs) as described above. Groundwater analytical results from these monitoring well samples are summarized in Table 3 and presented graphically on Figure 4. Copies of the laboratory reports are provided in Appendix B.

3.6 LNAPL Gauging

LNAPL was not detected in any of the monitoring wells identified on the site. A separate recovery sump containing used oil was identified on site, but this sump was an integrated component of an oil-water separator skimmer recovery system. At the time of the subsurface investigation LNAPL was not observed in any of the borings drilled and it did not appear to be migrating away from the oil water separator and recovery

sump. Monitoring well MW-15, which reportedly contained 0.1-0.2 inches of free product in 2003 could not be found, and is believed to be buried or destroyed.

4.0 DISCUSSION OF ANALYTICAL RESULTS

The analytical results from the limited subsurface investigation were compared to Part 213 Tier I non-residential risk based screening levels (RBSLs) for soil and groundwater under Michigan 1994 P.A. 451, as amended. Although residential properties border the site to the south and east, the areas where contamination are present are a considerable distance from these properties, and the areas of investigation are not likely to be repurposed for residential use in the foreseeable future.

The Tier I non-residential RBSLs were used for an initial comparison during this investigation, with the understanding that these RBSLs may not be appropriate at very high concentrations where LNAPL may be present.

Soil pathways considered relevant for this site included groundwater-surface water interface protection (GSIP), soil volatilization to indoor air inhalation (SVIAI), and direct contact (DC). While not specifically a pathway, the soil saturation concentration screening levels (CSAT) were included to evaluate the potential for LNAPL to be present. It should be noted that the CSAT values are applicable only to single compound concentrations, and may not be valid where chemical mixtures are present.

Groundwater pathways considered relevant for this site included groundwater-surface water interface (GSI), volatilization to indoor air inhalation (VIAI), and groundwater contact (GDC). Drinking water is not considered relevant at this site because the entire area is serviced by municipal water and is in an area where groundwater is not considered to be in an aquifer, and hence is not a potable source.

4.1 Soil Analytical Results

Analytical data from soil samples collected during the subsurface investigation indicated 14 of 30 soil borings contain concentrations of VOCs and/or PNAs above Part 213 RBSLs for relevant pathways (Figure 3). The samples collected from SB-13(2-4) and SB-30(2-4) exceeded the GSIP, SVIAI, DC, and CSAT RBSLs. All other samples exceeded only the GSIP RBSL. Most of the samples with elevated concentrations and

levels above RBSLs were collected from the upper 2 to 6 feet of fill material, or from the shallowest part of the clay unit. The contamination appears to be distributed to shallow depths, possibly indicative of surface spills of petroleum infiltrating through cracks in the concrete or releases from shallow pipelines accumulating in the fill or on top of the clay directly below the concrete surface. One sample, SB-3(2-4), was analyzed for diesel range organics (DRO) and oil range organics (ORO). DRO results were 500,000 $\mu\text{g}/\text{kg}$ (500 mg/kg) and ORO results were 3,500,000 $\mu\text{g}/\text{kg}$ (3,500 mg/kg). These are relatively high values and could be indicative of remnant diesel fuel LNAPL in soil pore spaces.

4.2 Groundwater Analytical Results

Six groundwater samples were collected in January-February 2012: three were collected from soil borings (SB-5, SB-17 and SB-18) and the remaining three were collected from the on-site monitoring wells (MW-2, MW-3, and MW-7). The sample collected from SB-5 was the only groundwater sample containing any compound above an RBSL. 1,2,4-trimethylbenzene was reported at 25 $\mu\text{g}/\text{L}$, which is above the GSI RBSL. This sample also contained other compound, including 1,3,5-trimethylbenzene (3.9 $\mu\text{g}/\text{L}$), benzene (25 $\mu\text{g}/\text{L}$), ethylbenzene (12 $\mu\text{g}/\text{L}$), xylenes (17.4 $\mu\text{g}/\text{L}$), naphthalene (4 $\mu\text{g}/\text{L}$), and pyrene (1 $\mu\text{g}/\text{L}$), all at concentrations below the RBSLs. Trace concentrations of various trimethylbenzene compounds were detected in the samples collected from MW-2 and MW-3, but at levels below any RBSLs. None of the other groundwater samples contained VOCs, PNAs or metals above laboratory method detection limits or selected RBSLs.

Eight groundwater samples were collected from all on-site and off-site monitoring wells on August 17, 2012. Of these, only two contained petroleum hydrocarbon compounds above the laboratory method detection limit. The groundwater sample collected from MW-11 contained naphthalene at 9.9 $\mu\text{g}/\text{L}$ and benzene at 3.5 $\mu\text{g}/\text{L}$. Both of these concentrations are below the selected RBSLs. MW-11 is an off-site well located across the property line from on-site MW-15, a well which formerly contained LNAPL. The groundwater sample collected from MW-12 contained the highest concentrations of petroleum compounds, including naphthalene at 30 $\mu\text{g}/\text{L}$, benzene at 4,500 $\mu\text{g}/\text{L}$, toluene at 11 $\mu\text{g}/\text{L}$, ethylbenzene at 330 $\mu\text{g}/\text{L}$, 1,2,3-trimethylbenzene at 39 $\mu\text{g}/\text{L}$, 1,2,4-trimethylbenzene at 200 $\mu\text{g}/\text{L}$, 1,3,5-trimethylbenzene at 33 $\mu\text{g}/\text{L}$ and total xylenes at 232 $\mu\text{g}/\text{L}$. Of these, the naphthalene, benzene, ethylbenzene, 1,3,4-trimethylbenzene and

xylénes concentrations exceed the GSI RBSL. None of the other six groundwater samples collected from on-site and off-site monitoring wells contained VOCs or PNAs above laboratory method detection limits.

5.0 FEASIBILITY STUDY

5.1 Exposure Pathway Characterization

The potential sources of exposure at the facility are impacted soil and shallow groundwater. Potential transport mechanisms include volatilization and atmospheric dispersion, volatilization and closed space accumulation, soil leaching to groundwater, groundwater transport, and migration along utility corridors.

Soil or groundwater ingestion, direct contact with impacted soil or groundwater, and inhalation of volatilized constituents would be potential exposure routes. Potential receptors to the exposure routes would include construction workers, commercial utility workers, personnel working in nearby structures, and underground utilities (especially storm sewers).

5.2 Feasibility Analysis

A feasibility analysis was performed to determine the appropriate corrective action for the site. This analysis considered each option in terms of effectiveness of cleanup, duration, and cost.

5.2.1 Soil Corrective Action Alternatives

Natural Attenuation: Impacted soils could remain in-place since there is a concrete cover over all impacted areas and existing monitoring wells could be monitored on a regular basis. This alternative requires continued maintenance of the concrete and does not provide cleanup for contaminated soils detected above RBSLs along the property boundary and off-site. This alternative will not eliminate acute risks to human health and to the environment without institutional or engineering controls. Institutional controls to prevent significant changes to the land use may eventually be required and due care provisions may proscribe engineering controls to address the volatilization to indoor air inhalation pathway if it is determined to be complete. Natural attenuation is considered a viable alternative if it can be demonstrated that all relevant pathways are securely closed. The cost for this alternative is lower than other alternatives and the exposure risks to human health and the environment can be managed using institutional controls, engineering controls (e.g. indoor ventilation systems and

impermeable barriers), and monitoring (e.g. groundwater wells, soil gas points, and storm drains at the property boundaries).

Soil Excavation: Impacted soil could be excavated and removed to a disposal facility. This would require the excavation and disposal of approximately 1,000 to 2,000 cubic yards or more of soil, filling the excavated areas with clean backfill and replacing demolished concrete. The cost to conduct this alternative and replace newly installed concrete on-site and off-site is considered relatively high. The areas where soil is impacted above RBSLs are not contiguous across the site and are in areas occupied by USTs that have been closed in place, close to or under foundations, or in areas occupied by underground equipment and utilities. Excavation would be very difficult and expensive, considering that underground fuel pipes, USTs (active and closed in place), oil-water separators, storm drains, fiber-optic cables, and other utilities are in the area of soil impacts. Although this alternative would be effective and could complete remediation within a short timeframe, excavation is considered costly, impracticable, and is not recommended.

Soil Vapor Extraction/Air Sparging: Soil vapor extraction (SVE) is an alternative that can reduce the volume of petroleum hydrocarbons in the soil, and to a lesser degree, in groundwater. Vent wells would be installed in the area of impacted soil and connected to a vacuum blower that would discharge through activated carbon, a catalytic oxidizer, or other vapor treatment apparatus, before venting to the atmosphere under the provisions of an air quality permit. Separate vapor treatment systems would be required at the North UST area and the SE UST areas. The vapor collection system would require a vast network of underground piping, buildings, electrical power, and would need to be monitored and maintained on a very frequent basis.

SVE is best implemented in conjunction with air sparging or ozone sparging, where air or ozone is forced under pressure into the saturated soils. The micro-bubbles strip hydrocarbons from the saturated soils and groundwater and ideally carry the contaminant in vapor phase to the unsaturated zone where it is collected by the SVE system.

The Soil Vapor Extraction/air sparging alternative is not viable for several reasons: depth to water in the shallow fill materials is insufficient to allow high volumes of vapor from the unsaturated zone. Significant water would be pulled into the system resulting in high maintenance effort and inefficient operation. The impermeable nature of the native clays underlying shallow fill will not support air sparging, which requires a reasonable soil permeability to be effective. Therefore, this alternative is not recommended.

5.2.2 Groundwater and LNAPL Corrective Action Alternatives

Monitored Natural Attenuation: The extent of contaminated groundwater has not increased between the last sampling events in 2002-2003 and the most recent sampling events in 2012. Groundwater occurs only in the shallow fill materials to a depth of 4-6 feet and may not have a migration pathway away from the release areas. With the extent of groundwater contamination remaining stable, it is likely that natural attenuation is taking place.

However, the groundwater concentrations of hydrocarbons, even the more soluble and volatile components like benzene, have not decreased over this same time period. The consistent concentrations of dissolved phased compounds over time suggests that LNAPL is trapped in soil pore spaces near the former release locations and acting as a continuing source of dissolved phase contaminants. Groundwater contamination is prevented from spreading vertically by extensive impermeable clays and is stable horizontally due to natural attenuation and possibly geological physical constraints. Risks associated with groundwater contamination at this site are minimal, with the possible exception of the GSI pathway via storm sewers. Natural attenuation of groundwater and LNAPL is a viable alternative for this site, so long as monitoring and suitable due-care provisions are employed to detect changes in groundwater conditions and steps are taken to mitigate migration through preferential pathways. This option assumes no changes in current land use.

In-Situ Chemical Oxidation and Bioremediation: Petroleum hydrocarbons can be destroyed in place through in-situ chemical oxidation (ISCO) or by in-situ bioremediation. Both processes involve injecting mixtures of chemicals and/or nutrients into the impacted subsurface soils.

In the case of ISCO, an oxidizing compound is injected into the impacted zone to cause a Fenton's reaction to chemically oxidize and destroy hydrocarbons, reducing them to carbon dioxide, water, and other benign oxidation by-products. The concentrations of contaminants and the presence of LNAPL do not affect the effectiveness of ISCO, except in the quantity of ISCO product that would be required to oxidize higher concentrations of contaminants. Natural oxygen demand (COD, BOD, etc.) would need to be considered in planning any ISCO implementation. ISCO is toxic to organisms, and could temporarily deplete the population of soil microbes that may currently be degrading hydrocarbons. Initial applications of ISCO often cause an initial release of contaminants from an immobile state to a dissolved mobile state, and concentration rebounds are not uncommon, requiring multiple rounds of application. Because ISCO is an oxidation process, significant heat can be generated and corrosion to underground utilities can occur, depending on the strength of oxidant used.

In the case of in-situ bioremediation, nutrients and electron acceptors are injected into the subsurface, modifying the environment to stimulate growth of naturally occurring pre-existing aerobic or anaerobic bacteria capable of breaking down hydrocarbons through metabolic or co-metabolic processes. It is important to understand the current micro-environment to properly implement bioremediation and additional studies would be necessary to determine the amendments that would achieve the desired results. Areas where contaminant concentrations are high may be more anaerobic, while other areas may be in an aerobic environment. LNAPL is often toxic to some bacteria and bioremediation may be less effective where LNAPL or very high dissolved concentrations exist. Multiple applications of bio-stimulants are often necessary for best results.

Both technologies can be implemented without the installation of an extensive subsurface infrastructure. Repeat applications are possible, and usually necessary. Of the two methods, ISCO may be more practical at this site in that only the oxygen demand is a requisite factor for planning ISCO, and ISCO can be effective in both soil and groundwater. However, many of the same site conditions that limit the effective use of soil vapor extraction hinder the effective use of both ISCO and in-situ bioremediation. The widespread nature of the contaminant in isolated pockets across

the site, unknown bio-geochemical conditions at the site, and the impermeability of the native clays would make this option difficult to implement. Therefore, these alternatives are not recommended.

Groundwater / LNAPL Pump and Treat: A groundwater / LNAPL collection system could collect LNAPL and contaminated water, separate the water from LNAPL, and treat impacted groundwater by using activated carbon or other treatment alternative to remove petroleum hydrocarbons. The shallow thickness of the permeable fill would result in very limited radius of influence for any pumping system, and would necessarily have to operate at very low recovery rates. Any groundwater / LNAPL pump & treat system will be expensive to install and operate, and would require a permitted discharge to sanitary or storm water sewers. LNAPL would need to be collected as disposed by a licensed waste disposal contractor. The groundwater pump and treat alternative is not viable due to the limited thickness of the water bearing fill materials and the low hydraulic conductivity of the underlying native clays. Therefore, this alternative is not recommended for corrective action at the site.

Air/Ozone Sparging: An air or ozone sparging system for groundwater remediation strips volatile organic hydrocarbons from soil and groundwater in the saturated zone and transports the contaminants to the vadose zone where vapors are collected by an SVE system. Ozone is a strong oxidizing agent and ozone sparging has the added benefit of adding a limited ISCO process to the remediation efforts. Air/Ozone sparging is not viable due to the limited thickness of the water bearing fill materials and the low hydraulic conductivity of the underlying native clays. Therefore, this alternative is not recommended for corrective action at the site.

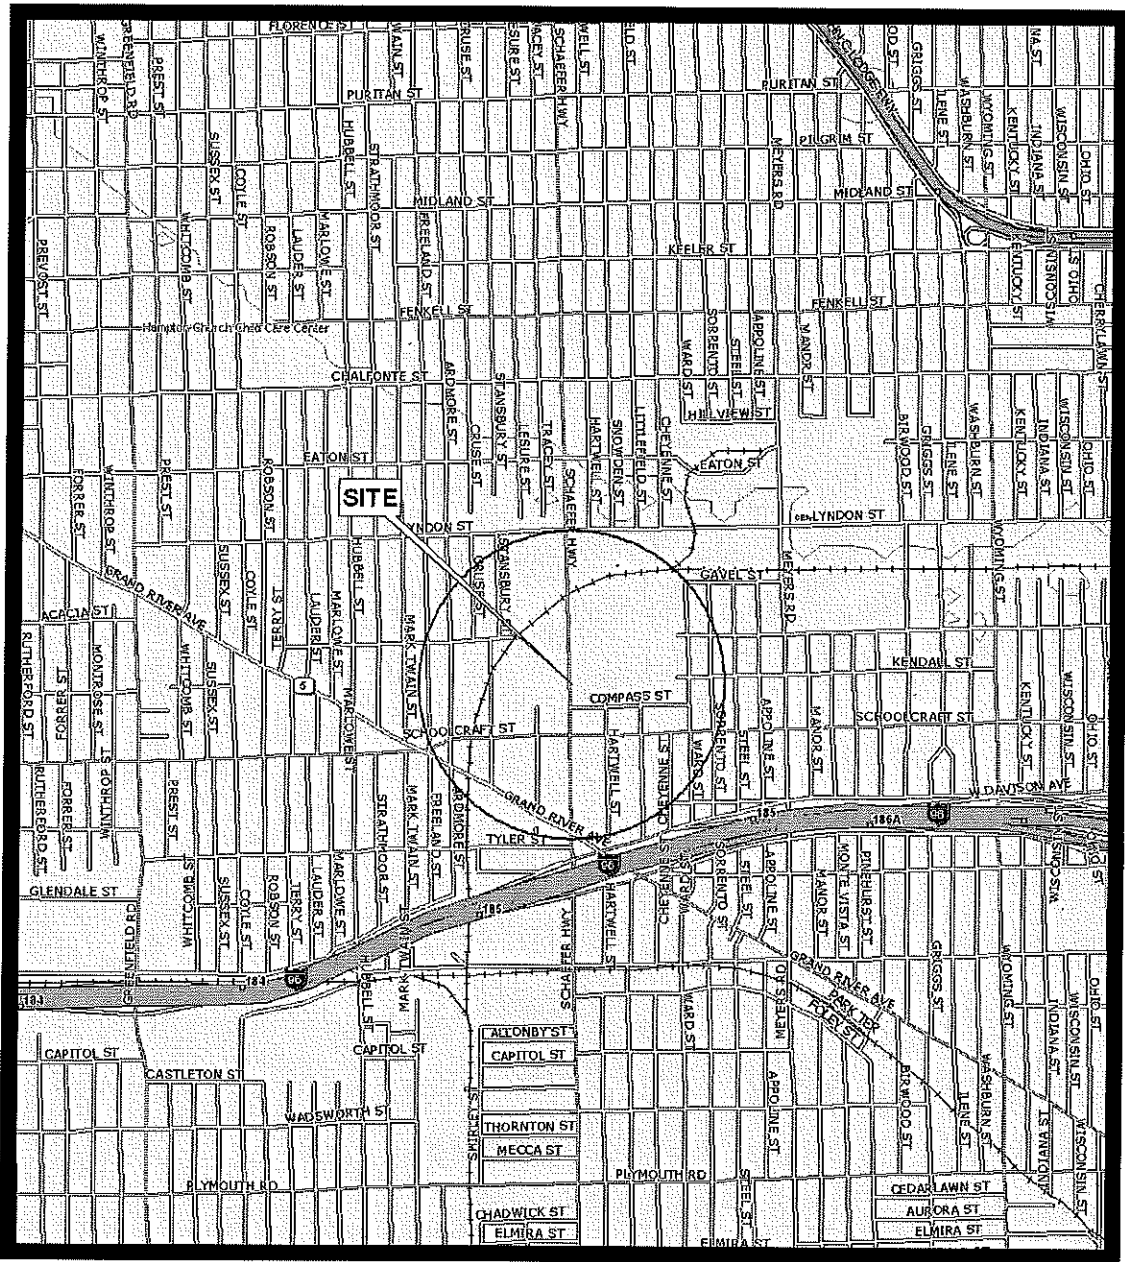

5.3 Feasibility Analysis Comparison Table

Corrective Action Alternative	Cost	Effectiveness	Duration
Soil Excavation	High	Good	Immediate
SVE - Air/Ozone Sparging	High	Poor	Moderate
Monitored Natural Attenuation	Low	Fair	Long-Term
GW/LNAPL Pump & Treat	High	Poor	Long-Term
ISCO / Bioremediation	Moderate	Poor	Short-Term

The selected corrective action alternative is Monitored Natural Attenuation with appropriate due care provisions. Given the current land use and the land use in the foreseeable future, and the stable and immobile nature of the soil and groundwater contaminants, this alternative is the most appropriate choice. Monitored natural attenuation is cost effective and can be implemented without immediate concerns of unacceptable risks to human health and the environment. Due-care requirements must be emplaced for this alternative to be protective. These may involve some additional investigation to determine whether storm water sewers in contact with contaminants pose a GSI risk, and to evaluate indoor air inhalation risks associated with residual soils. Because the garage already uses an indoor ventilation system in compliance with OSHA and MIOSHA worker safety regulations, there may be no risks to site workers from volatilization of contaminants from the subsurface. If monitoring shows that site conditions change or if exposure risks are shown to be higher than anticipated, excavation would be the best fallback alternative.

**INTERIM RESPONSE ACTIVITIES OF
UNDERGROUND STORAGE TANK HAZARD
(An RPF PROJECT)**

**SCOPE OF WORK
FOR**

SITE INFORMATION:	City of Detroit – DDOT 14044 Schaefer HWY Detroit, MI 48227	Wayne County Facility ID #:13464 Southeast Michigan (SEMI) District
-------------------	---	---

Site Location & Background:

The property is located at the northeast corner of Schaefer Hwy and Schoolcraft, in northwest Detroit. The surrounding is mostly small commercial business and an auto salvage yard west of Schaefer.

There were a total of 24 USTs installed at the site previously. Eighteen USTs were either removed or closed-in-place from December 1999 to January 2000. Contents of the removed USTs included dextron, converter/oil, engine oil, used oil, gasoline, diesel, and water. The remaining six USTs are used to store diesel, gasoline, and used oil. The capacities of the 24 USTs ranged from 500 gallons to 50,000 gallons. There are 4 opened confirmed releases associated with the removed USTs. Free product was also discovered at the site.

Interim response activities at the site consisted of the removal and disposal of 272 gallons of free product, 2,800 gallons of contaminated groundwater, and 2,540 cubic yards of impacted soil. The limited investigation conducted at the site indicates that soil borings installed at the site were converted to 24 temporary wells and nine permanent monitor wells.

The limited investigation conducted thus far is inadequate to determine the extent of free product, soil, and/or groundwater contamination.

Scope of Work

The Scope of work of this project is to conduct a remedial investigation (RI), including source areas of contamination at the. Subsequent to completion of the RI, a Feasibility Study (FS) shall be conducted to identify appropriate remediation alternatives for mitigation of free product, as well as contamination in soil and ground at the site. The RI shall include delineation of the soil and groundwater contamination plumes on, and off-site.

Please note that the project deliverable shall consists of a Project Completion Report that details, among others, the post RI status of the site and an FS which recommends cleanup alternatives, in conformance with Risk-Based Corrective Actions. Also, the DEQ Project Manager shall be provided with a copy of the Project Completion Report on a digital medium; i.e. compact disk/flash drives.

Please note that the **Bid Specifications** for this project shall be selected by Level of Effort firm.

Budget and Time Constraints

It is expected that the project completion timeline may extend to November 2012. Submittal of all project close-out documents should be completed by May 2013.

DEQ Project Team

Paul Owens, District Supervisor

Michelle Bakun, District Enforcement Coordinator

Pewu Bah-deh, Project Manager

Special Considerations/Unique Conditions

The site is an active City of Detroit Bus Depot; therefore, City employees and contractual workers may be present at any time. Federal, State, and local health and safety regulations shall be complied with, and, special care must be exercised to preserve the health, safety, and welfare of everyone at the site.

RE: Contract RD #8010, Requested OF-60
City of Detroit-DOT (Bus Depot), 14044 Schaefer Hwy., Detroit, Michigan
Site ID # 82002470

Dear Mr. Simons:

At the request of the State Project Manager, Mr. Pewu Bah-Deh, Gannett Fleming of Michigan, Inc. has prepared four original copies of the attached Work Plan, OF-60 and modification form (DMB 410 pg. 1) for your review and approval. The scope and associated costs have been reviewed and approved by Mr. Bah-Deh.

Please contact me with any questions.

Sincerely,

GANNETT FLEMING OF MICHIGAN, INC.

1.0 INTRODUCTION

The Michigan Department of Environmental Quality–Remediation Division (MDEQ-RD) has directed Gannett Fleming of Michigan, Inc. (Gannett Fleming) to implement the scope of work (SOW) described in this Work Plan for the following Site:

City of Detroit – DOT
14044 Schaefer Highway
Detroit, Wayne County, Michigan

The City of Detroit – DOT site location is provided on Figure 1. The MDEQ-RD Project Manager and key technical contact for the Site is Mr. Pewu Bah-Deh.

1.1 Site Background and Description

The City of Detroit – DOT property (Site) is located at 14044 Schaefer Highway in Detroit, Wayne County, Michigan. The Site is currently a bus depot operated by the Detroit Department of Transportation (DDOT) and has historically been used by the DDOT for an unknown number of years. Improvements on the Site include a garage building, several smaller buildings used currently or historically for DDOT operations, and areas of pavement covering most of the remaining property. The Site is zoned for commercial use and is bounded a salvage yard to the west (across Schaefer), a shipping facility to the north, and mostly small commercial properties elsewhere.

According to information reviewed by Gannett Fleming, 17 underground storage tanks (USTs) were installed at the Site in 1946 and two more were installed in 1979-80. These USTs contained various materials, including diesel fuel, gasoline, engine oil, convertor oil, Dexron (transmission fluid), used oil, and water, and were of sizes ranging from 500 to 50,000 gallons. All of these tanks were removed or closed-in-place in 2000. During the tank removal, 2,540 cubic yards of impacted soil, 2,800 gallons of impacted

groundwater and 272 gallons of free product were excavated and disposed off site. Four confirmed releases were reported for the Site in 1999 and 2000. The products released were diesel fuel, gasoline and engine oil. A diesel transfer pipe failed near the garage building in 2000, causing the evacuation of the building.

Limited site investigations were conducted at the site between 1999 and 2001. As part of these assessments, 24 soil borings were performed and 24 temporary wells and nine permanent monitoring wells were installed. Data from these sampling location indicated that contamination had moved off-site and a Notice of Off-Site Migration was filed with the MDEQ. These investigations were summarized in an Initial Assessment Report and a Final Assessment Report.

Six USTs, currently in use, were installed at the Site in 2001. These include four 25,000-gallon diesel tanks, one 10,000-gallon gasoline tank and one 1,000 gallon used oil tank. Subsequently, free product has been observed in monitoring well MW-15 (April 2003). In 2006 a fifth confirmed release was reported. A leaking diesel fuel clamp was found to be the source of this leak and no response activities were performed by the DDOT concerning this leak.

The Site is considered to be out of compliance with Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environment Response Act, Act 451 of 1994, as amended. The City of Detroit has not conducted any response activities since 2003 and due to financial hardship is considered a non-viable liable party.

1.2 Project Objectives

The project objectives are summarized below:

- Determine the present level and location of soil and groundwater contamination at the Site.

- Determine the present location of free product at the Site.
- Assess the potential for and risk due to vapor intrusion into the on-site garage building.
- Identify alternatives for remediating the free product source area and the soil and groundwater contamination at the Site.

The areas to be investigated include the northern USTs and pump areas and the former eastern USTs and pump areas. The scope of work was developed based on existing data, currently known site conditions communicated by the MDEQ and the City of Detroit, and observation during a recent site visit.

2.0 SCOPE OF WORK

Gannett Fleming has prepared this Work Plan for the MDEQ-RD review and approval prior to initiation of the site activities. The Work Plan identifies actions necessary to achieve the objectives stated in Section 1.2. Tasks to be completed include:

- Kick-off Meeting
- File Review
- Site Reconnaissance
- Access Agreement
- Pre-Work Notification
- Site-specific Health and Safety Plan (HASP)
- Geophysical Survey Utility Clearance
- Soil and Groundwater Sampling and Free Product Assessment
- Soil Gas Sampling
- Disposal of Investigation Derived Wastes
- Feasibility Study
- Project Completion Report

These tasks are described in detail in the following sections.

2.1 Kick-Off Meeting

Prior to the preparation of this Work Plan, a project kick-off meeting was held at the MDEQ Southeast District office on September 21, 2010, with the MDEQ-RD Project Manager and Southeast Michigan District Supervisor to review the project objectives and scope of work. An on-site meeting was also conducted on September 27, 2010, with personnel from Gannett Fleming, MDEQ, and DDOT.

2.2 File Review

Available files pertaining to the Site have been/will be provided to Gannett Fleming for review of historical information. Documents to be reviewed include, but may not be limited to the Final Assessment Report (December 31, 2001) prepared by The Traverse Group, facility drawings/plans from the DDOT, and other release information in MDEQ files.

2.3 Site Reconnaissance

Gannett Fleming assessed the current conditions at the Site and made contact with Site management through the performance of a site walk through on September 27, 2011. Additional reconnaissance work will be conducted prior to invasive activities to identify underground utilities and other subsurface features (see Section 2.7), and establish traffic flow patterns and work areas.

2.4 Access Agreements

The MDEQ has requested that Gannett Fleming work directly with DDOT for site access and scheduling. Therefore, Gannett Fleming will complete an access agreement with DDOT as an agent of the MDEQ. If off-site construction and/or investigation activities are necessary on any roadway or right of way, Gannett Fleming will obtain the access agreement for the right-of-way, City, County, and the Michigan Department of Transportation (MDOT) properties, and any other adjacent properties as needed, prior to initiating any activities. Access agreements will cover any activities to be performed by both Gannett Fleming and any subcontractors.

2.2 File Review

Available files pertaining to the Site have been/will be provided to Gannett Fleming for review of historical information. Documents to be reviewed include, but may not be limited to the Final Assessment Report (December 31, 2001) prepared by The Traverse Group, facility drawings/plans from the DDOT, and other release information in MDEQ files.

2.3 Site Reconnaissance

Gannett Fleming assessed the current conditions at the Site and made contact with Site management through the performance of a site walk through on September 27, 2011. Additional reconnaissance work will be conducted prior to invasive activities to identify underground utilities and other subsurface features (see Section 2.7), and establish traffic flow patterns and work areas.

2.4 Access Agreements

The MDEQ has requested that Gannett Fleming work directly with DDOT for site access and scheduling. Therefore, Gannett Fleming will complete an access agreement with DDOT as an agent of the MDEQ. If off-site construction and/or investigation activities are necessary on any roadway or right of way, Gannett Fleming will obtain the access agreement for the right-of-way, City, County, and the Michigan Department of Transportation (MDOT) properties, and any other adjacent properties as needed, prior to initiating any activities. Access agreements will cover any activities to be performed by both Gannett Fleming and any subcontractors.

2.5 Pre-Work Notifications

The MDEQ-RD Project Manager and assigned DDOT contact person will be notified of any on-site activities at least 48 hours in advance of the scheduled work.

2.6 Site-Specific Health and Safety Plan

Gannett Fleming will prepare a site-specific HASP to provide specific guidelines and establish procedures for the protection of personnel during the activities conducted at the Site. The HASP procedures will be amended if additional information is discovered that requires alteration of the HASP.

Personnel conducting activities on-site where a potential exposure exists must have current training in hazardous waste operations and emergency response (HAZWOPER). Personnel conducting and overseeing site activities must also be familiar with the procedures and provisions of the HASP. In the event of conflicting plans/requirements, personnel will implement those safety practices that afford the highest level of protection. The HASP will be based upon currently available information and developed in accordance with the requirements set forth in 29 CFR 1910.120 Hazardous Waste Operations and Emergency Response; Final Rule.

The Project Manager will be directly responsible for all aspects of the project, both technical and administrative. The Site Safety Officer is responsible for all aspects of health and safety during site activities. The Site Safety Officer will be responsible for ensuring that the HASP is implemented properly at all times during site operations. If the Site Safety Officer is not on-site during site operations, the senior Gannett Fleming personnel present will assume the duties of the Site Safety Officer.

2.7 Geophysical Survey Utility Clearance

Prior to initiating any subsurface work activities, Gannett Fleming staff will contact the MISS DIG one-call utility locating service to mark public utilities on and near the work areas. Some underground utilities and the UST system piping and components will not be marked by the utility companies. To avoid hitting underground structures, Gannett Fleming staff will mark proposed locations of all soil borings and arrange for a subcontractor, experienced in subsurface geophysical techniques, to conduct a subsurface geophysical survey to clear proposed boring locations. Electromagnetic conductivity (EM), ground penetrating radar (GPR) and other geophysical survey tools may be used to identify subsurface features and eliminate risks of hitting utilities or underground UST components during drilling.

2.8 Soil and Ground Water Sampling and Free Product Assessment

An investigation will be conducted at the Site, specifically around the locations of the current tanks north of the garage building and around the former location of removed tanks 9, 10 and 19, near the southeast corner of the garage building. Geoprobe® sampling technology will be used to collect the subsurface samples for on-site screening and off-site laboratory analysis. The lithologic conditions will be recorded at each boring by the on-site geologist. Temporary wells will be installed at select boring locations to facilitate the collection of groundwater samples for analysis.

Up to twenty soil borings will be installed to in the area of the current tanks and up to twelve more will be installed near the southeast corner of the garage building. The borings will be advanced to an approximate depth of 20 feet below ground surface (bgs) to characterize soils down to and including the capillary fringe. Two soil samples will be collected from each of the boring locations: one at the vadose zone interval that

exhibits the highest photo-ionization detector (PID) reading, and another at the capillary fringe.

Temporary wells will be installed at up to eight soil boring locations and groundwater samples will be collected from these locations using a peristaltic pump and disposable tubing in general accordance with minimal drawdown/low-flow groundwater sampling techniques.

In addition, groundwater level measurements and groundwater samples will be obtained at each of the nine existing monitoring wells on the Site, if found and accessible. The water levels will be used to determine groundwater elevations and estimate groundwater flow direction. Sampling from these wells will be by the same method described above. All wells will be checked for free product using an interface probe in order to locate the extent of the free product plume.

The former USTs at the Site were used to store gasoline, diesel fuel, waste oil, transmission oils, and other petroleum mixtures and distillates. Consequently, the soil and groundwater samples will be analyzed for the following:

- Petroleum related volatile organic compounds (VOCs), including benzene, toluene, ethylbenzene, xylenes (BTEX); tri-methylbenzenes (TMBs); and methyl tert-butyl ether (MTBE) by USEPA SW846 Method 8260.
- Polynuclear aromatic hydrocarbons (PNA) compounds by USEPA SW846 Method 8270.
- Lead by USEPA SW-846 6020.
- Select samples with high suspected concentrations of organic contaminants will be analyzed for gasoline range organics (GRO) and diesel range organics (DRO) to help evaluate whether free-phase product is present where the soil saturation concentrations (CSAT) might be exceeded.
- Select samples may be analyzed using toxic characteristic and synthetic precipitation leaching procedures (TCLP and SPLP) to assist with waste characterization for later waste disposal.

All soil samples collected for VOC analysis shall be preserved in accordance with SW-846 Method 5035. Soil and/or ground water samples collected during the assessment activities will be submitted to the MDEQ-RD Environmental Laboratory in Lansing, Michigan, following proper chain-of-custody protocol. Gannett Fleming will coordinate with the laboratory to acquire the necessary sampling kits and containers.

The data obtained from the sample analysis will assist in completing the site characterization and reviewing corrective action alternatives for the feasibility study evaluation.

2.9 Soil Gas Sampling

Gannett Fleming will install soil gas probes in up to four soil borings located adjacent to north wall of the DDOT garage building. The soil gas probes will be used to collect "air" samples from the soil pore spaces at depth to evaluate the concentrations of volatile organic compounds within the pores spaces. This will help evaluate the potential risks associated with indoor air inhalation in the surrounding property buildings.

The soil gas probes will consist of a machine slotted or perforated "implant" set into the boring at a depth 10-feet below the foundation of the building, connected to the surface with flexible inert tubing, and sealed from the surface using bentonite or cement. A vacuum pump will be connected to the exposed tubing at the surface used to evacuate one to three air volumes from the tube, inducing a flow of soil pore gases into the implant. A vacuum bottle or SUMA canister will then be attached via flow controlled regulator to the tubing and allowed to fill with soil pore gases. When the vacuum reaches ambient pressure, the containers will be removed and sent to the MDEQ Laboratory for VOC analysis via USEPA method TO-15.

2.10 Disposal of Investigation Derived Wastes

All investigation derived wastes (IDWs) generated as part of this site characterization will be placed in DOT approved steel drums and kept at a secure on-site location approved in advance by the DDOT. The wastes will be characterized using data obtained during the sample collection activities (Section 2.8) and disposed at a licensed off-site facility once approvals for landfill/treatment facility acceptances are received. Gannett Fleming will solicit bids from qualified subcontractors to transport and dispose of the IDWs and provide manifests and documentation for MDEQ records. Gannett Fleming can sign the waste manifests on behalf of the MDEQ or the DDOT upon receipt of authorization from the appropriate party to provide that function.

2.11 Feasibility Study

Gannett Fleming will consolidate previously available site information and incorporate new data from this site characterization to evaluate the nature and extent of soil, groundwater and free-phased product contamination in comparison to the generic Part 213 RBSLs for non-residential properties. The potential exposure pathways and risks to the environment and human health will be evaluated to determine what courses of action may be effective in eliminating exposure pathways and averting risks. These may be a combination of remedial action measures, engineering controls, and land use restrictions.

Possible options for eliminating the exposure pathways or removing free-phased product will be evaluated and compared in a decision matrix and discussed individually in a comprehensive Feasibility Study report, which will be included in the final Project Completion Report (Section 2.12). Gannett Fleming will provide recommendations for the best course of action to meet the MDEQ and DDOT objectives for closing this site, or seeking an administrative partial closure.

2.12 Project Completion Report

At the completion of all project activities, Gannett Fleming will prepare a comprehensive report summarizing all work conducted at the site, presenting all data, and discussing the findings of the investigation. The report will include a discussion of the site background, the project objectives, work completed as part of the site characterization, and findings, and include maps, tables, boring logs, analytical results, and other data pertinent to documenting the site characterization efforts. The report will also include a conclusions and recommendations section, as well as the Feasibility Study Report in its entirety.

3.0 PROJECT PERSONNEL

The project organization consists of a Program Manager, Project Manager, and other Gannett Fleming personnel needed to complete the project. The chain of command, as well as the duties of each team member, is outlined below.

The Principal in Charge (PIC) for this project is John Kovacs, Midwest Regional Manager based in the Pittsburgh office. The PIC is responsible for ensuring that the execution of the project is in accordance with Gannett Fleming standards and that the project adheres to Gannett Fleming's regional and national financial/business goals/objectives.

The Program Manager is the main contact to the client contract administrators. The main responsibilities of the Program Manager are to make sure that the objectives of the client are met on a contractual level, and to confirm that projects are moving forward at a pace acceptable to the client. The Program Manager oversees the project execution for all projects performed under this contract and assigns projects to Project Managers based on the understanding of the project needs and Gannett Fleming's resources. The Program Manager will be responsible for the quality assurance (QA) of the project. The Program Manager for this project is Craig Savage in the Michigan District Office.

The Project Manager is responsible for meeting the client project-specific objectives and executing the project within the budget and schedule. Craig Savage will serve as the Project Manager for this project. While filling both roles of Project Manager and Program Manager, Craig Savage will ensure that the client's objectives for the project are met.

Other Gannett Fleming personnel will be assigned throughout the execution of this project. For this project, personnel include: engineers Brian Kardos and Martha Hannah;

geologists Dave Straccia and Ron Friend, and billing specialist/CAD technician Shirley Garlej.

4.0 PROJECT SCHEDULE

The project duration is estimated at approximately eight to ten months, depending on weather and site availability. Included in Figure 2 is an estimated timeline, subject to change based on project needs.

Progress Reports will be submitted monthly to the MDEQ-RD Project Manager. The reports will provide information regarding the progress of the project and recent findings. The progress reports will also include planned activities and budget updates.

5.0 PROJECT BUDGET

The estimated budget to implement the SOW as outlined in this Work Plan is \$66,048.16. The estimated costs are summarized in Table 1. This budget includes Gannett Fleming's labor and other direct costs. All analytical costs will be paid directly by the MDEQ-RD.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

S = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s); RL raised.

J = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Bolded indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

5 = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s); RL raised.

J = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Bolded indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

ug/L = micrograms per liter

RL = Reporting Limit

GS = Grab Sample

NA = Not Applicable

5 = Result and RL are estimated due to low continuing calibration standard criteria failure.

D = Analyte value quantified from a dilution(s); RL raised.

J = Analyte was positively identified. Value is an estimate.

P = Recommended sample collection/preservation technique not used; reported result(s) is an estimate.

T = Reported value is less than the reporting limit (RL). Result is estimated.

X = Analyte has boiling point above 200C and is better suited to analysis by method 8270 as semivolatile organic.

Bolded indicates concentration exceeds laboratory method detection limit.

Shaded indicates concentration exceeds one or more applicable RBSL.

Analytical results are only shown for analytes that were detected.

**AMENDED FINAL ASSESSMENT REPORT
DETROIT DEPARTMENT OF TRANSPORTATION
COOLIDGE FACILITY, 14404 SCHAEFER HWY.
DETROIT, MI**

1.0 INTRODUCTION

Since the submittal of the Final Assessment Report (FAR), dated December 31, 2001, additional investigation activities were conducted (as proposed in Section 5.0 of the FAR). The purpose of conducting the additional investigation activities was to complete delineation off-site and to determine the groundwater characteristics/conditions upon completion of the site construction/renovation activities (consisted of concrete restoration, communication line removal/installation, demolition of above ground storage tank system, and demolition of the pump house) and approval of off-site access north of the site (O.H. Frisbie Moving and Storage).

A summary of the additional investigation activities and information not provided in the FAR are presented in the following sections of this report. In addition, updated figures, tables, and appendices are attached (refer to the Table of Contents for listing).

2.0 ADDITIONAL INVESTIGATION ACTIVITIES

The following additional investigation activities were conducted since the submittal of the FAR:

- A total of twenty-six borings were advanced. These borings were advanced by hand-auger (HA-6 through HA-14 and MW-15), hollow stem auger drilling (SB-1 through SB-4, MW-2, MW-3, MW-7, and MW-10 through MW-15), and Geoprobe® drilling (GP-36 through GP-41, GP-43 through GP-45).
- A total of four temporary monitor wells (HA-8, HA-10, HA-12, and GP-39) and nine permanent monitor wells (MW-2, MW-3, MW-7, MW-10 through MW-15) were installed.

Sample locations are depicted on Figures 3 and 4. Soil boring logs and well construction diagrams generated since the submittal of the FAR are included in Appendix A. Field procedures were conducted in accordance to Traverse Group's Field Standard Operating Procedures (SOPs), refer to Appendix D.

3.0 SUMMARY OF ANALYTICAL RESULTS

Soil and groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, and xylenes (BTEX) and trimethylbenzenes (TMBs) by U.S. EPA Method 8260, polynuclear aromatics (PNAs) by U.S. EPA Method 8270, and lead by U.S. EPA Method 6010/6020. These parameters were selected based on the known contents of the former tanks and historical analytical data from previous investigations conducted at the site. Soil analytical results are presented in Tables 1 through 4 and groundwater analytical results are presented in Tables 5 through 8.

Samples collect along the northern property boundary and off-site were compared to Tier I Residential Risk-Based Screening Levels (RBSLs). Samples collected on the site were compared to Tier I Commercial III RBSLs. The results of this comparison are summarized in Sections 3.1 (Soil Analytical Results) and 3.2 (Groundwater Analytical Results).

3.1 Soil Analytical Results

Analytical data from soil samples collected on-site were compared to the Commercial III RBSLs. The results of the comparison indicated that the following concentrations were detected above the Commercial III RBSLs (refer to Tables 1 and 3).

- 8N End (2-3' bg) - 1,2,4-trimethylbenzene (130,000 ug/kg).
- 13S Sidewall (3-4' bg) - benzene (9,300 ug/kg).
- GP-44 (2.5-3' bg) - 1,2,4-trimethylbenzene (160,000 ug/kg), xylenes (220,000 ug/kg).

3.2 Groundwater Analytical Results

Analytical data from groundwater samples collected on-site (Figure 3) were compared to the Commercial III RBSLs. The results of the comparison indicated that the following concentrations were detected above the Commercial III RBSLs (refer to Tables 5 and 7).

- GP-10 (7-12' bg) - benzo(a)anthracene (19 ug/L), benzo(a)pyrene (9 ug/L), benzo(b)fluoranthene (19 ug/L), benzo(k)fluoranthene (7.6 ug/L), chrysene (10 ug/L).

Analytical data from groundwater samples collected from the northern property boundary and off-site (Figure 3) were compared to the Residential RBSLs. The results of the comparison indicated that the following concentrations were detected above the Residential RBSLs (refer to Tables 6 and 8).

- MW-12 – benzene (5,700 ug/L).
- HA-1 (6-7' bg) – benzene (7,900 ug/L).
- HA-2 (6-7' bg)– anthracene (250 ug/L), benzo(a)anthracene (250 ug/L), benzo(a)pyrene (25 ug/L), benzo(b)fluoranthene (25 ug/L), benzo(g,h,i)perylene (25 ug/L), benzo(k)fluoranthene (25 ug/L), chrysene (250 ug/L), dibenzo(a,h)anthracene (25 ug/L), fluoranthene (250 ug/L), indeno(1,2,3,-cd)pyrene (25 ug/L), 2-methylnaphthalene (44,000 ug/L), pyrene (250 ug/L).

4.0 FREE PRODUCT DISCOVERY AND REPORTING

On April 16, 2003, free product was discovered on-site during a groundwater sampling event. The free product was detected in monitor well MW-15. Approximately 6-ounces (0.9-inches in thickness) of free product were removed from the well by hand-bailing with a disposable bailer and containerized in a 55-gallon steel drum (appropriately labeled and stored on-site pending disposal). All nearby monitor wells were screened for the presence of free product. Nearby storm drain catch basins and utility manholes were screened for possible hazardous or explosive vapors. The results of the screening indicated that no hazardous or explosive vapors were

quantity of free product encountered. For additional information, refer to the Quarterly Free Product Report (prepared by The Traverse Group and dated July 14, 2003).

As indicated in the July 2003 Quarterly Free Product Report, free product delineation will be conducted during the installation of the remediation system (September 2003). The next Quarterly Free Product Report is scheduled to be submitted to the Michigan Department of Environmental Quality (MDEQ) on or before October 15, 2003.

5.0 SITE CLASSIFICATION CHANGE

Since the submittal of the FAR, the site classification has changed from Class 3 to 1 due to the discovery of free product in MW-15.

6.0 CHANGES TO THE WORK PLAN OUTLINED IN THE FAR

The Work Plan summarized in the FAR (Section 5.3C) was implemented. Based on the conditions encountered in the field, additional soil borings and monitor wells were installed and the proposed sampling locations were adjusted for delineation and determination of groundwater characterization purposes.

7.0 ESTIMATED VOLUME OF IMPACTED SOIL IN THE VADOSE ZONE

The estimated volume of impacted soil above Residential RBSLs located on the northern property boundary and off-site is approximately 800 cubic yards (110 feet length x 20 feet width x 10 feet depth). The estimated volume of impacted soil above Commercial III RBSLs located on the site is approximately 300 cubic yards (10 feet length x 10 feet width x 3 feet).

8.0 SOIL REMEDIATED SINCE SUBMITTAL OF THE FAR

Since the submittal of the FAR, approximately 1,520 cubic yards of soil were removed and disposed off-site during site construction and renovation activities. The soil was transported and disposed at Waste Management Woodland Meadows landfill located in Wayne, Michigan (refer

9.0 GROUNDWATER CHARACTERIZATION AND CONDITIONS

Groundwater elevation data and contour map (April 14, 2003, elevation data) are presented in Table 9 and in Figure 7, respectively.

Site data were compared to the MDEQ Operational Memorandum No. 11 for the purpose of determining whether the groundwater at the site yields useable quantities to be considered an aquifer. The results of the comparison indicated that the groundwater encountered at the site is not an aquifer. The following findings were used for this comparison:

- Monitor wells installed within native material (clay) bailed dry after sustained bailing of less than 5-gallons, excluding the volume of groundwater initially present in the well casing and filter pack.
- Groundwater was encountered at depths ranging from 4 to 12 feet bg. As indicated in the boring logs (refer to Appendix A), saturation was observed from two-inch sand seams or fill material. In addition, the sand seams appear to be discontinuous across the site.
- Drinking water at the site and in the area is supplied by the city of Detroit. Wells installed and used for the purpose of drinking water is not allowed due to the city of Detroit Ordinance 256H.
- Five permanent monitor wells, each with 5-foot screens, were installed during the April/May 2002 investigation to obtain site hydrogeologic information. Monitor well locations are depicted on Figures 3 and 4. Limited hydrogeologic information was obtained from these wells, due to the low hydraulic conductivity of the native clays underlying the site.
- Temporary monitoring wells GP-1, GP-10, GP-39, and HA-2 bailed dry after purging and sampling.

10.0 EXPOSURE PATHWAY CHARACTERIZATION

The potential source of exposure at the facility is impacted soil. Potential transport mechanisms include volatilization and atmospheric dispersion, volatilization and closed space accumulation, leaching and groundwater transport, and utility corridors.

Soil or groundwater ingestion, direct contact with impacted soil or groundwater, and inhalation of volatilized constituents would be potential exposure routes. Potential receptors to the exposure routes would include construction workers, commercial utility workers, structures, and utility corridors. The identified exposure pathways are consistent with the FAR; therefore, no new exposure pathways were identified since the submission of the FAR.

11.0 FEASIBILITY ANALYSIS

A feasibility analysis was performed to determine the appropriate corrective action for the site. This analysis considered each option in terms of effectiveness of cleanup, duration, and cost.

11.1 Soil Corrective Action Alternatives

- *Natural Attenuation.* Impacted soils could remain in-place since there is a concrete cover over all impacted areas and existing monitor wells could be monitored quarterly. This alternative requires continued maintenance of the concrete and does not provide cleanup for contaminated soils detected above applicable RBSLs along the property boundary and off-site. This alternative will not eliminate acute risks to human health and to the environment; therefore, it is not recommended for an appropriate corrective action at the site.
- *Soil Excavation.* Impacted soil could be excavated and removed to a disposal facility. This would require the excavation and disposal of approximately 1,100 cubic yards of

- *Soil Vapor Extraction.* Soil vapor extraction is an alternative that can reduce the volume of petroleum hydrocarbons in the soil. Vent wells would be installed in the area of impacted soil and connected to a vacuum blower that would discharge to an activated carbon treatment system. Vapor would be removed in the activated carbon and then discharged to the atmosphere under the provisions of an air quality permit. A small building would be required to house the blower and activated carbon system. The Soil Vapor Extraction alternative is not viable due to the native clays underlying the site. Therefore, this alternative is not recommended.
- *Bioremediation.* The installation of a PER-PETUAL™ hydrogen peroxide remediation system (refer to Appendix B). The hydrogen peroxide will be pumped from a large storage tank through a control panel, which will regulate and distribute a very slow flow of peroxide through tubing to each injection point. Tubing will be routed through a network of trenches from the control panels to each point. There will be two types of injection points: 1) Shallow points which are designed to remediate shallow contaminated soils and 2) Deep points to remediate deeper soils and select areas with groundwater contamination. The cost of the system installation is approximately \$35,000 and the duration of cleanup is estimated as 1.5 years. The effectiveness of the PER-PETUAL™ system has been proven (refer to Appendix B for performance system data). In addition to the system, the area located near former Tank 8 would be injected (6 points) with hydrogen peroxide to enhance contaminate cleanup in a short duration. This alternative is recommended based on relatively low cost, short duration of cleanup, and proven effectiveness.

11.2 Groundwater Corrective Action Alternatives

- *Natural Attenuation.* In this alternative impacted groundwater would continue to migrate

- *Groundwater Pump and Treat.* A groundwater collection system could treat impacted groundwater by using activated carbon to remove petroleum hydrocarbons. The groundwater pump and treat alternative is not viable due to the low hydraulic conductivity of native clays underlying the site and is considered costly. Therefore, this alternative is not recommended for corrective action at the site.
- *Bioremediation.* The installation of the two separate systems ((MAV™ and PER-PETUAL™), which consists of a small 6-point system for cleanup of the free product and a larger 42-point system for cleanup of impacted soil and groundwater, will rapidly recover free product for elimination and cleanup impacted groundwater on- and off-site within approximately 1.5 years. In addition, the cost for system installation and O&M is moderate to low. This alternative is recommended for corrective action at the site based on moderate cost, effectiveness, and short-term duration for cleanup.

11.3 Feasibility Analysis Comparison Table

Corrective Action Alternative	Cost	Effectiveness	Duration
Soil Excavation	High	Good	Immediate
Soil Vapor Extraction	High	Poor	Moderate to Long-Term
Natural Attenuation	Low	Poor	Long-Term
Bioremediation Systems (MAV™ and PER-PETUAL™)	Moderate	Good	Short-Term

The selected corrective action alternative is the Bioremediation Systems. This is the most viable and cost effective option. Refer to Appendix B for Remediation System Operation and Maintenance (O&M) Manuals which also includes the system design layout for the

12.0 CORRECTIVE ACTION PLAN

12.1 Description of Corrective Actions

The corrective action will include the use of two separate systems and hydrogen peroxide injection in the immediate vicinity of former Tank 8 at the Coolidge facility. The systems and additional cleanup measures to be provided at the site are as the following:

- The Multi-Array Vacuum (MAV™) system is designed (6 point system) to recover free product for rapid elimination. The system is designed to be modified into the PER-PETUAL™ system. Refer to Appendix B for system details on installation, operation, and maintenance.
- The PER-PETUAL™ system is designed (42-point system) to clean up contaminated soil (particularly clayey soils) and groundwater by injecting hydrogen peroxide through selected injection points (refer to Appendix B for system design layout). The hydrogen peroxide converts to hydroxyl free radicals, which breakdown organic compounds. The oxidation of organic compounds reduces the carbon chain into smaller and smaller particles (ultimately converting to carbon dioxide, water, and simple compounds). Refer to Appendix B for system details on installation, operation, and maintenance).
- Six shallow injection points (separate from the above systems) will be installed to insert hydrogen peroxide in the immediate vicinity of former Tank 8 to provide rapid cleanup of impacted soils.

12.2 System Construction and Installation

MAV™ System

The MAV™ system construction details and figure depicting the installation/construction of the system are included in Appendix B. The next section describes the installation of the PER-PETUAL™ system.

turned off if desired. The free product that intersects each MAV™ extraction point is recovered into the screen by the vacuum being conveyed through the system.

The installation of each MAV™ point will be installed by hand-auger techniques and hollow-stem auger (HAS) drilling. The borehole will be advanced to just below the groundwater interface. Over drilling the borehole by 2 feet will allow easy movement of the MAV™ point (up or down as needed). The points will be installed in the immediate area of MW-15 (system configured so that 1 foot stainless steel MAV™ screen bisects the groundwater interface within the free product plume), where free product is present. Free product will be delineated during the installation of the system. Six points are proposed; however, additional points may be installed based on field conditions encountered during system installation activities. The points will be installed in a grid fashion (10 feet grid spacing). The length of each point will be constructed on-site and customized for the well screen to intersect the groundwater interface (according to depth of groundwater at the location). Due to the surface topography and depth of groundwater, the MAV™ point locations and lengths may change from each location to the next. To accommodate for these changes, each MAV™ length point will be surveyed and calculated to allow for a margin of error. In areas anticipated to have fluctuations in depth to groundwater, couplers and extensions will be added or removed to and from the riser pipe to allow for adjustability of the screen.

As indicated in Section 11.1, the MAV™ system will be designed to be modified into the PER-PETUAL™ system. The MAV™ system works using a vac-truck for 36-hours, once per month.

PER-PETUAL™ System

Hydrogen peroxide will be pumped from a large storage tank through a control panel, which will regulate and distribute a slow flow of peroxide through tubing to each injection point (refer to Appendix B for system design layout for the site). Tubing will be routed through a network of trenches (consisting of 6" to 8" wide x 24" deep, level bottom, 750 linear feet) from the control panels to each point. There will be two types of injection points: 1) Shallow points designed to

Backfill will consist of 3 feet sand, 1 foot bentonite, and the remainder with cuttings. The tubing installation will consist of 3/8" outer diameter (OD) x 1/4" inner diameter (ID) polyethylene or HDPE tubing rated to 160 psi. Tubing will be routed through trenches from the control panel to each injection point. All of the trenches will be backfilled with pea gravel. The pavement will be restored to the existing pavement thickness. Concrete trenches will be pinned with 1/2" x 4" rebar on 18" centers on opposite walls of the trench cut. All waste soil and materials will be containerized and disposed of. Refer to Appendix B for additional system details.

12.3 Operation and Maintenance Plan

The installation for the system is scheduled for mid September 2003. Prior to system installation, a baseline sampling event will be conducted for existing monitor wells located on the north portion of the site and off-site. The MAV™ system will operate using a vac-truck for 36-hours, once per month. Upon completion of the recovery of free product, the system will be modified to the PER-PETUAL™ system.

The PER-PETUAL™ system will operate by continually injecting a regulated amount of hydrogen peroxide into the injection point. The average injection pressure is estimated between 25 to 75 psi. The pressure will be automatically regulated by the control panel. The hydrogen peroxide will drain by gravity through the control panel and tubing into the injection points. Since the system is designed to self-regulate, increased pressure developed during chemical oxidation and bioremediation (exceeding the pressure of the supplied compressed gas) at specific injection points will be automatically stopped by the control panel and later resume when the pressure drops. Hydrogen peroxide flow to the points that do not exceed the pressure of the supplied compressed gas will continue.

The maintenance of the system requires that the hydrogen peroxide tanks be refilled as needed. The intervals at which they are refilled will depend upon the amount of the hydrogen peroxide absorbed by oxidation and bioactivity.

month. After the first month, the system effectiveness will be monitored once per month for the next two months and then quarterly thereafter.

The groundwater samples collected will be submitted for laboratory analysis of BTEX, 1,2-dichloroethane, 1,2-dibromoethane, naphthalene, 2-methylnaphthalene, and TMBs by U.S. EPA Method 8260, PNAs by U.S. EPA Method 8270, and lead by U.S. EPA Method 6020. The results of the sample analysis will determine whether any adjustments to the amount of hydrogen peroxide being injected are required.

Quarterly monitoring results will be submitted to the MDEQ on a quarterly basis. Sampling protocol and procedures that will be conducted in accordance to the SOPs provided in Appendix D.

12.5 System Shutdown and Closure

Once appropriate RBSLs are achieved, the system will be shut-down. After system shut-down, quarterly sampling will be conducted for one year to monitor site conditions after shut-down. If site data indicates that contaminant concentrations are below applicable RBSLs after one year of monitoring, then the site will be prepared for closure.

In preparation for site closure, soil verification samples will be collected to determine if site conditions meet the criteria for closure. Upon determination of the site data meeting the requirements for closure, a Closure Report will be prepared and submitted to the MDEQ. The hydrogen peroxide storage tank, control panel, and the tubing will be removed upon approval of closure. The injection points will be decommissioned in-place with a bentonite/cement grout from the top of the tubes down into the injection points to seal the system and stop the movement of future contamination into the soil and groundwater.

Concentration is a screening level based on the chemical-specific generic soil saturation concentration (C_{sat}) since the calculated risk- based concentration is greater than C_{sat} are acceptable cleanup criteria for this pathway where a site-specific concentration is not present. NA = Not Applicable or not requested for analysis. NLV = Hazardous substance is not likely to volatilize under most conditions. ND = Not detected at or above the MDEQ method detection limit.

Highlighted and shaded values exceed one or more listed Cleanup Criteria.

C = Value presented is a screening level based on the chemical-specific generic soil saturation concentration (C_{sat}) since the calculated risk-based RBSL is greater than C_{sat}. Concentrations greater than C_{sat} are acceptable cleanup criteria for this pathway where a site-specific demonstration indicates that free-phase contaminant is not present. NA = Not Applicable or not requested for analysis. NLV = Hazardous substance is not likely to leach under most soil conditions. NLV = Hazardous substance is not likely to volatilize under most conditions. ID = Inadequate data to develop RBSL. ND = Not detected at or above the MDEQ method detection limit.

**LEAKING UNDERGROUND STORAGE TANK
SUPPLEMENTAL REPORT COVER SHEET**

INSTRUCTIONS: Complete this form with all applicable information. Attach this form to all supplemental Leaking Underground Storage Tank (LUST) submittals; this includes all reports other than the Initial Assessment, Final Assessment, and Closure Reports. The Certified Underground Storage Tank Professional (CP) MUST sign below. Please return this completed report cover sheet to the appropriate RRD District Office. See form EQP4410 for a complete list of RRD district offices. Use of this form to provide the listed information is voluntary.

IDENTIFY TYPE OF SUPPLEMENTAL REPORT: Quarterly Free Product Report

FACILITY NAME: Detroit Department of Transportation

FACILITY ID NUMBER: 00013464

STREET ADDRESS: 14044 Schaefer Hwy

CITY: Detroit

STATE: MI

ZIP CODE: 48227

COUNTY: Wayne

DATE(S) RELEASE(S) DISCOVERED: 1. 12/20/99, 2. 12/20/99,
3. 12/30/99, and 4. 1/25/00

CONFIRMED RELEASE NUMBER(S): 1. C-1332-99,
2. C-1333-99, 3. C-1388-99, and 4. C-88-00

O/O NAME: City of Detroit

O/O STREET ADDRESS: 5300 Chrysler Service Drive

STATE: MI

ZIP CODE: 48211

CONTACT PERSON: Ken Ong

PHONE NUMBER: 313.833.3000

ANSWER ALL QUESTIONS

1. Type(s) of product released: Diesel

2. Free product present:

a. Currently? YES NO

If YES, total gallons recovered since last report: 1.19

b. Previously? YES NO

If YES, total gallons recovered to date: 1.19

3. Have vapors been identified in any confined spaces (basement, sewers)? YES NO

4. Estimated depth to groundwater: 4 feet

Estimated groundwater flow direction: radial

5. Estimated distance and direction from point of release to nearest:

a. Private well: > 1/2 Mile

b. Municipal well: > 1/2 Mile

c. Surface water/wetland: Detroit River, > 1Mile South

6. Since last report: a. cubic yards of soil remediated: 1,520

b. gallons of groundwater remediated: 0

7. Totals to date: a. cubic yards of soil remediated: 6,260

b. gallons of groundwater remediated: 2,800

8. Michigan RBCA Site Classification (1-4): 1

9. Has contamination migrated off-site above Tier 1 Residential RBSLs YES NO

If YES, have off-site impacted parties been notified (per Section 21309a(3) of Part 213 YES NO

10. MTBE

Has MTBE been detected in any groundwater sample?

YES NO

Maximum MTBE concentration found in groundwater

39 ppb.

CERTIFICATION OF REPORT COMPLETION

I, the undersigned CP, hereby attest to the best of my knowledge and belief that the statements in this document and all attachments are true, accurate, and complete. I certify that the report was submitted to the Remediation & Redevelopment Division (RRD)

on July 14, 2003 (Date submitted REQUIRED)

FREE PRODUCT RECOVERY STATUS REPORT

Authorized by Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Act 451).

<p>INSTRUCTIONS: Use the checklist below to ensure that all required information is provided in the Quarterly Free Product Recovery Status Report and submit WITH THE SUPPLEMENTAL REPORT COVER SHEET (EQP3849) to the appropriate Remediation & Redevelopment Division (RRD) district office. See form eqp4410 for a complete list of RRD district offices. Include this checklist as a table of contents. Each page of the report should be consecutively numbered. The location column should be completed with the appropriate page number for each item. Refer to Storage Tank Division Operational Memorandum No. 7 for further instructions. The reporting schedule may be altered at the discretion of the DEQ project manager based on site conditions.</p>	<p>FACILITY ID NUMBER: 00013464</p> <hr/> <p>SITE NAME: Detroit Department of Transportation</p> <p>COUNTY: Wayne</p>

Section	Table of Contents	Page
1.0	<u>ACTIVITIES COMPLETED</u> Section 21307(2) and (3)(b),(c)	
	A. Describe response activities completed to address free product.	1
2.0	<u>EXPOSURE PATHWAY EVALUATION</u> Section 21307(2)(a),(e) and (3)(c)	
	A. Identify and describe complete exposure pathways related to the free product.	2
	B. Provide a scaled site map, which shows the extent of free product including the utility corridors, buildings with or without basements, private wells, and sensitive habitat/surface water.	1, Figure 1
3.0	<u>DATA TREND ANALYSIS</u> Section 21307(2)(c)(i),(ii) and (3)(c)	
	A. Provide a data summary table for all wells that contain free product. The table should include monitoring point location, date sampled, depth to water, free product thickness, and quantity of free product removed.	2, Table 1
	B. Provide graphs of static water elevations of a well near the free product plume versus free product apparent thickness compared over time. These graphs should be provided for all monitoring wells that have shown free product.	2, Graph 1
	C. Provide graphs of static water elevations versus groundwater concentration (e.g., Benzene, MTBE, and/or total BTEX) in select downgradient monitoring wells compared over time.	NA
4.0	<u>FEASIBILITY ANALYSIS ON SELECTION OF RECOVERY SYSTEM</u> Section 21307(2)(c)(i),(ii) and (3)(c), and 21308a(1)(b)(xviii)	
	A. Provide initial and any subsequent bail-down test recovery data, analysis of which will determine the frequency of recovery. Refer to the references in Storage Tank Division Operational Memorandum No. 7 for sample calculations.	2, Graph 2
	B. Attach a schematic drawing of the free product recovery system.	2
5.0	<u>PERMITTING AND WASTE DISPOSAL TRACKING</u>	
	A. Provide copies of manifests or trip logs of liquid industrial waste or recycling per Section 21307(2)(c)(iii) and (3)(c), and 21308a(1)(b)(xvii)(H).	2
	B. Provide the air quality sampling results and calculations to meet Rule 290 of the Air Pollution Control Rules promulgated under Part 55, Air Pollution Control, of Act 451.	2
6.0	<u>OPERATION AND MAINTENANCE RECOVERY DATA</u> Section 21307(2)(c)(i),(ii) and (3)(c)	
	A. Describe any free product system design modifications, since last submittal.	2
	B. Provide the action levels that may trigger a change in remediation strategy.	2
7.0	<u>PROPOSED FUTURE ACTIONS</u> Section 21307(2)(e) and Section 21309a(2)(e)	
	A. Provide a schedule for free product evaluation and groundwater sampling.	3
	B. Provide a schedule outlining the next operation and maintenance activities.	3
	C. Provide the date of the next report.	3

FREE PRODUCT DISCOVERY, IMMEDIATE RESPONSE, AND REPORTING

Free Product Discovery

During a groundwater sampling event conducted on April 16, 2003, free product was discovered in monitor well MW-15 (refer to the attached Site Sketch for location) at the site.

Immediate Response Activities

Approximately 1.08 inches of free product thickness was measured and 0.05 gallons of free product were removed from MW-15 (refer to Table 1 for free product elevation data and removal quantities). The free product was removed from MW-15 by hand bailing using a disposable bailer and containerized in a 55-gallon steel DOT approved drum that was properly labeled and stored on-site. Existing monitor wells on- and off-site were gauged during the sampling event and free product was not present in any other monitor wells. In addition, the site was surveyed for possible fire, explosion, and vapor hazards. The results of the survey indicated that no fire, explosion, or vapor hazards were present.

Reporting

The Michigan Department of Environmental Quality (MDEQ) was notified within 24-hours by fax transmittal using the MDEQ Free Product Fax Transmittal form.

Following the May 15, 2003, site visit, monthly site visits have been continued to date. A monthly site visit was conducted on June 26, 2003 to gauge apparent free product thickness and perform free product recovery.

FREE PRODUCT REMOVAL ACTIVITIES

After the discovery of free product in MW-15, the site was monitored for free product on a weekly basis for one month. Since the quantity of free product removed was consistent, the frequency of the free product site monitoring visits was revised to monthly.

Field data obtained from the first monthly (June 26, 2003) free product site monitoring visit indicated a slight increase in free product thickness but not a significant increase. Based on this information, the frequency of free product monitoring site visits will continue monthly and free product recovery will be performed by hand-bailing techniques.

The next monthly free product site monitoring visit is scheduled for July 25, 2003. During the site visit, the existing nearby monitor wells on- and off-site will be screened. If it is determined that the quantity or thickness of free product has significantly increased

or free product is discovered in other monitor wells, the current free product recovery method will be revised to an active recovery system.

EXPOSURE PATHWAY EVALUATION

Exposure pathways applicable to the site are consistent with the Final Assessment Report (FAR).

FREE PRODUCT DELINEATION

An Amended FAR is in the process of being completed for submittal to the MDEQ by the end of July 2003. Free product will be delineated during the installation of the proposed remediation system (as summarized in the Corrective Action Plan of the Amended FAR). A summary of the free product delineation activities and results will be presented in the next Quarterly Free Product Report (October 15, 2003).

DATA TREND ANALYSIS

Free product elevation data, apparent free product thickness, and quantity of free product removed from April 16, 2003 through June 26, 2003 is presented in Table 1. Graph 1 depicts the static water level elevations of MW-15 versus the apparent free product thickness over time. Graph 2 depicts the results of a free product bail-down test performed at MW-15

FEASABILITY ANALYSIS ON SELECTION OF RECOVERY SYSTEM

On April 17, 2003, a bail-down test was performed at MW-15. The bail-down test recovery data for MW-15 is provided on Graph 2. Based on the free product thickness and quantity encountered since June 26, 2003, monthly free product monitoring and recovery by hand-bailing method is appropriate. However, if the results of the free product delineation activities or monthly free product site monitoring indicate an unstable or increasing free product plume, then the current recovery system will be immediately revised to stabilize and reduce the plume.

PERMITTING AND WASTE DISPOSAL TRACKING

Free product recovered from MW-15 to date (a total of 1.19 gallons) was placed in a properly labeled, DOT approved, 55-gallon drum, and stored on-site.

Air quality sampling and calculations are not deemed necessary at this time since the free product is recovered by hand-bailing using a disposable bailer.

PROPOSED FUTURE ACTIONS

Monthly Free Product Monitoring

Monthly free product monitoring and recovery will continue.

Free Product Delineation Activities

The free product plume will be delineated during the installation of the remediation system. The results will be included in the next Quarterly Free Product Report.

Next Quarterly Free Product Report

The next Quarterly Free Product Report will be submitted to the MDEQ on or before October 15, 2003.

ANSWER ALL QUESTIONS (DO NOT LEAVE BLANKS):

1. a. Has the UST been emptied? [x] Yes [] No (If no, explain why):

b. Has the UST system been properly closed? [x] Yes [] No (If no, explain why):

2. Free product present: a. Currently? [] YES [x] NO If YES, total gallons recovered since last report: None

b. Previously? [] YES [x] NO If YES, total gallons recovered to date: None

3. Have vapors been identified in any confined spaces (basement, sewers, etc.)? [] YES [x] NO

4. State the number of homes where drinking water is or was affected as a result of a release from this facility: 0

5. Estimated distance and direction from point of release to nearest: a. Private well: > 1/2 Mile b. Municipal well: > 1/2 Mile c. Surface water/wetland: > 1 Mile South of the site is the Detroit River.

6. Totals to date: a. cubic yards of soil remediated: Approx. 1,020 b. gallons of groundwater remediated: None

7. Michigan RBCA Site Classification (1-4): 3

CERTIFICATION OF REPORT COMPLETION

MICHIGAN DEPARTMENT OF ENVIRONMENTAL QUALITY - STORAGE TANK DIVISION
INITIAL ASSESSMENT REPORT (Continued)

Instructions - Utilize the following checklist to ensure that all required information is provided in the Initial Assessment Report (IAR). Include this checklist as the table of contents. The order in which the information is provided is at your discretion. Each page of the report (including the cover sheet, table of contents, appendices, figures, etc.) should be consecutively numbered. The location column should be completed with the appropriate page number for each item. You may reference previously submitted materials by specifying the location within that document. Maps, tables, figures, etc. should be combined as appropriate.

All information required by Part 213 to be included in the IAR **must** be provided, and all sections of the report must be completed. If any items are not applicable to the site, provide a justification regarding the absence of this information in the appropriate section of the report.

Section	Table of Contents	Page
1.0	<u>INITIAL RESPONSE TO RELEASES</u>	
A.	Provide the date and time the release(s) was/were discovered and reported.	10
B.	Indicate what portion of the underground storage tank (UST) system is, or is believed to be, the source of the release.	10
C.	Describe how the release was discovered.	11
D.	Describe any tank tightness testing performed in response to this release and provide the following:	11
	1. Date of the testing	
	2. Method of testing	
	3. Results of the testing	
E.	List all former and existing USTs at this facility including the following information for each of these tanks:	11
	1. Tank ID Number (as registered)	
	2. Contents (past/present, if gasoline specify grade and whether leaded or unleaded)	
	3. Size of the UST	
	4. Whether the tank was identified as a leaking underground storage tank (LUST)	
	5. Whether the tank has been emptied and/or removed. If a LUST, provide an explanation if not emptied or removed	
F.	Describe the initial response actions which were performed at this site, as specified in Sections 21307(2)(a) through (c), and (3)(a) and (b).	12
2.0	<u>REPORTING AND RESPONSE FOLLOWING THE DISCOVERY OF FREE PRODUCT</u>	
	If free product has not been discovered, proceed to Section 3.0.	
A.	Describe initial response actions performed at this site to address the presence of free product as specified in Sections 21307(2)(c) and (f), and (3)(b) and (c), 21308a(1)(b)(xviii). Refer to the STD Operational Memorandum No. 7, <i>Identification, Reporting, and Recovery of Free Product at LUST Sites</i> .	12
B.	Attach the STD Free Product Recovery Status Report (EQP 3850).	12
C.	Include a schedule for subsequent Free Product Report submittals.	12

Section	Table of Contents	Page
3.0	<u>SITE CHARACTERIZATION INFORMATION</u>	
3.1	SCALED SITE MAPS	
A.	Provide a scaled area map (or maps) which includes the following:	
1.	Site boundaries in relation to the surrounding area and the nearest major roads	12
2.	Location and depth of nearby underground sewers and utility lines	Figure 2
3.	Location of nearby surface waters or wetlands	Figure 1
4.	Location and screened depth of all off-site wells (municipal, residential, production, irrigation, etc.) within two years groundwater travel time of the property line, which may be dependent on the pumping rates of the identified well(s)	NA
5.	Location of all nearby delineated well-head protection areas	NA
B.	Provide a scaled site map (or maps) which includes the following:	
1.	Location of fill ports, piping, dispensers, and other pertinent system components for all UST systems currently or formerly at the facility (<i>prior to excavation if tanks have been removed</i>)	Figure 2
2.	Location of the release and the component of the LUST system from which the release occurred	13
3.	Location of adjacent buildings, roadways, paved areas, or other structures	Figure 2
4.	Location of all on-site wells and screened intervals	Figure 2
5.	Location of soil, groundwater, surface water, sediment or air samples, as applicable	Fig. 3,4,5
6.	Excavation dimensions and sample locations if applicable	Fig. 3,4,5
3.2	SCALED CROSS-SECTIONAL DIAGRAMS	13
A.	Provide scaled cross-sectional diagrams of buried utility corridors, including the pipe diameter, the type of backfill, and the trench depth.	NA
B.	Provide scaled cross-sectional diagrams depicting the soil lithology and the contaminant distribution, including sampling intervals and boring depths.	NA
C.	Provide scaled cross-sectional diagrams depicting the site hydrogeology, including the groundwater potentiometric surface, the monitoring well screened intervals, and sampling intervals.	NA
3.3	SOIL CONDITIONS AND CHARACTERISTICS	
A.	Describe the soils encountered in the vadose zone.	14
B.	Describe any soil contamination which has been detected.	14
C.	Describe any soil remediation or disposal activities performed to date, including the total volume of soil remediated or disposed. Indicate the disposal location, and provide proof of disposal (e.g., invoices, not load tickets).	17

Section	Table of Contents	Page
D.	Provide a site diagram which identifies the estimated horizontal and vertical extent of on-site and off-site soil contamination. Include the maximum concentrations and sample depths.	17
E.	Provide an estimate of the volume of impacted soil remaining in the vadose zone.	17
F.	Describe steps that have been taken, or will be taken, to secure access to <u>off-site</u> properties, including easements and right-of-ways, to complete the delineation of the extent of the <u>off-site</u> impact of the release to soil. Include the names and addresses of potentially affected off-site property owners.	18
G.	Provide the schedule for completing the delineation of the extent of the <u>off-site</u> impact of the release to soil.	18
H.	Provide a table with field screening and laboratory data showing the results of all soil sampling performed to date for the required parameters. Refer to the STD Operational Memorandum No. 14 <i>Analytical Parameters and Methods, Sample Handling, and Preservation for Petroleum Releases</i> .	Tables 1, 2a & 2b
	<ol style="list-style-type: none"> 1. Sample ID 2. Sample depth 3. Date of collection 4. Dates of extraction and analysis 5. Method Detection Limits 6. Analytical method or field screening instrument 	
	<i>(NOTE: The STD may request copies of the laboratory data sheets, chain-of-custody forms, and all available QA/QC information.)</i>	
I.	Provide a table which compares the maximum remaining soil contaminant concentrations for each required parameter to the appropriate RBSLs as provided in STD Operational Memorandum No. 4 <i>Tier I Lookup Tables for Risk-Based Corrective Action at Leaking Underground Storage Tank Sites</i> . If residential leaching to groundwater RBSLs are not utilized for comparison, provide an explanation.	19
J.	Provide soil boring logs.	19
K.	Identify any known soil contamination not related to the release and the source, if known.	NA
3.4	GROUNDWATER CONDITIONS AND CHARACTERISTICS	
A.	Describe the site hydrogeology, and include the following:	
	<ol style="list-style-type: none"> 1. Depth to groundwater and method of determination 	20
	<ol style="list-style-type: none"> 2. Whether the groundwater is potable and/or not in an aquifer. Provide the basis for this determination. Refer to STD Operational Memorandum No.11 <i>Criteria to Eliminate the Potable Groundwater Pathway</i>. 	20

Section	Table of Contents	Page
	3. Whether the groundwater is currently used as a source of drinking water, either residential or municipal	20
	4. Whether groundwater is being used for a purpose other than drinking water	20
	5. Whether more than one groundwater unit is present beneath the site	20
	6. Depth to bottom of water-bearing layer	NA
	7. Predominant soil type in water-bearing stratum (e.g., sand, silt)	20
	8. Effective porosity of water-bearing stratum (in $\text{cm}^3_{\text{void}}/\text{cm}^3_{\text{matrix}}$), and describe how it was determined	NA
	9. Hydraulic conductivity, and describe how it was determined	NA
	10. Groundwater flow rate and direction	NA
	11. Lateral component of the hydraulic gradient	NA
	12. Hydrogeologic conditions that could influence flow direction	NA
	13. Magnitude and direction of the vertical component of the hydraulic gradient	NA
B.	Attach copies of the following:	
	1. Boring logs	Attach. A
	2. Well construction diagrams	NA
	3. Potentiometric surface map	NA
	4. Elevation data (USGS datum preferred), including top-of-casing, and grade elevations, and depth to groundwater	NA
C.	Provide scaled maps and cross-sectional diagrams, showing the screened and/or sampling interval, which depict the extent of impact and the maximum concentrations.	Fig. 4
D.	Indicate whether more than one groundwater unit has been impacted.	NA
E.	Describe any groundwater remediation activities performed to date, including the total volume of groundwater remediated and the disposition of this groundwater.	NA
F.	Provide an indication of whether the plume currently extends off-site.	21
G.	Describe steps that have been taken, or will be taken, to secure access to <u>off-site</u> properties, including easements and right-of-ways, for the purpose of completing the delineation of the extent of the release to groundwater, and provide the names and addresses of off-site property owners.	21
H.	Provide the schedule for completing the delineation of the extent of the off-site impact of the release to groundwater.	21
I.	Provide a table with field screening and laboratory data showing the results of all groundwater sampling performed to date for the required parameters. Refer to the STD Operational Memorandum No. 14. The table should include the following:	
	1. Sample ID	
	2. Sample depth and/or screened interval	
	3. Date of collection	
	4. Dates of extraction and analysis	
	5. Method Detection Limits	Table 3

Section	Table of Contents	Page
	6. Analytical method or field screening instrument	
	<i>(NOTE: The STD may request copies of the laboratory data sheets, chain-of-custody forms, and all available QA/QC information.)</i>	
	J. Provide a table which compares the maximum remaining groundwater contaminant concentrations for each required parameter to the appropriate RBSLs as provided in STD Operational Memorandum No. 4. If residential health-based/aesthetic drinking water criteria are not utilized for comparison, provide an explanation.	Table 4
	K. Identify any known groundwater contamination not related to the release and the source, if known.	NA
3.5	CONDITIONS AND CHARACTERISTICS IN OTHER ENVIRONMENTAL MEDIA	
	A. Describe the evaluations conducted to determine if other environmental media have been impacted.	NA
	B. Describe the extent and distribution of any contamination present in any environmental media other than soil or groundwater.	NA
	C. Describe any actions taken or planned in response to contamination in other environmental media.	NA
	D. Describe steps that have been taken, or will be taken, to secure access to <u>off-site</u> properties, including easements and right-of-ways, to complete the delineation of the extent of the <u>off-site</u> impact of the release to the other specified environmental media. Provide names and addresses of potentially affected off-site property owners.	NA
	E. Provide a schedule for completing the delineation of the extent of the <u>off-site</u> impact of the release to the other specified environmental media.	NA
	F. Provide a table with the field screening and laboratory data showing the results of all sampling performed to date in the other specified environmental media.	NA
	<i>(NOTE: The STD may request copies of the laboratory data sheets, chain-of-custody forms, and all available QA/QC information.)</i>	
	G. Identify any known contamination in the other specified media not related to the release, and the source if known.	NA
4.0	<u>SITE CLASSIFICATION</u>	
	A. Indicate the current Site Classification Level, in accordance with STD Operational Memorandum No. 5, <i>Leaking Underground Storage Tank (LUST) Site Classification System</i> .	22

Section	Table of Contents	Page
---------	-------------------	------

B. Provide a justification for this classification. Identify the current conditions that are the basis of the classification, and dates that the prescribed initial response actions were implemented.	<u>22</u>
--	-----------

5.0 RESULTS OF THE RBCA EVALUATION

5.1 EXPOSURE PATHWAY CHARACTERIZATION

A. Identify and describe the following (Figure 2, <u>Exposure Scenario Evaluation Flowchart</u> , provided in the <i>ASTM RBCA E 1739-95</i> , may be utilized):	
1. Potential source(s)	<u>22</u>
2. Potential transport mechanism(s)	<u>22</u>
3. Potential exposure routes(s)	<u>22</u>
4. Potential receptor(s)	<u>22</u>
B. List each possible exposure pathway(s) for each land use, and sensitive habitat (if applicable) for the site. Provide an explanation for eliminating any pathways.	<u>23</u>

NOTE: A complete pathway must include three necessary elements:

- 1) a source (e.g., contamination);*
- 2) a mechanism by which the contamination can become available to result in exposures at the source or via migration to other locations (e.g., free product and contaminated groundwater movement along a buried utility corridor); and*
- 3) an individual who may come into contact, ingest, or inhale the contamination at the point of exposure (e.g., a utility maintenance worker digging to repair the line).*

Examples of a complete pathway include:

- 1) inhalation of impacted soils by an on-site construction worker*
- 2) impacted soils leaching into potable ground water and being used by a nearby resident for drinking and bathing*
- 3) inhalation of vapors resulting from the migration of free product by a neighboring industrial worker*
- 4) impacted groundwater discharging to wetlands.*

5.2 OPTIONAL TIER II EVALUATION

A. Indicate whether a site-specific Tier II or evaluation has been conducted for this site.	<u>NA</u>
B. If applicable, identify and justify where alternate assumptions or site-specific information were used in place of the default assumptions as defined in the STD Operational Memorandum No. 4.	<u>NA</u>
C. Provide the calculations and reference citations supporting the development of the relevant Tier II SSTLs.	<u>NA</u>

Section	Table of Contents	Page
---------	-------------------	------

- D. Provide a table which compares the maximum remaining contaminant concentrations for each required parameter for all media to the appropriate RBSLs (as provided in the STD Operational Memorandum No. 4), and the calculated SSTLs. Identify all applicable land use scenario(s), and indicate whether or not there is an exceedance of the RBSLs or the SSTLs.

NA

5.3 PROPOSED FOLLOW-UP ACTIVITIES

- A. Based on the results of the Tier I or optional Tier II evaluation, indicate the follow-up activities proposed for the site, (e.g., site closure; interim corrective action with subsequent reevaluation; final corrective action to achieve Tier I RBSLs or Tier II SSTLs; or perform further site-specific Tier II or Tier III evaluation to establish alternative SSTLs that meet the target risk goals).

24

- B. Provide justification for the option chosen.

24

- C. Provide a Work Plan and implementation schedule that describes the proposed site characterization activities to be performed to determine the horizontal and vertical extent of contamination. Include a scaled site map depicting proposed sampling locations.

24

1.0 INITIAL RESPONSE TO RELEASES

A. Provide the date and time the release(s) was/were discovered and reported.

Confirmed Release Number	Date & Time Discovered	Date & Time Reported	Substance Released	Location of Release (Figure 2)
C-1332-99	12/20/99 9:00 am	12/20/99 9:40 am	Engine Oil & Gasoline	Piping associated with Tank No. 9, 10, & 19
C-1333-99	12/20/99 12:40 pm	12/20/99 2:34 pm	Gasoline	Piping associated with Tank No. 12
C-1388-99	12/30/99 12:00 pm	12/30/99 2:53 pm	Residual Oils & Diesel	Area of closed-in-place Tank No. 5, 6, 7, & 8 and Tank No. 14, 16, & 18.
C-88-00	1/25/00 2:09 pm	1/26/00 10:08 am	Diesel	Area of closed-in-place Tank No. 1, 2, & 3

B. Indicate what portion of the underground storage tank (UST) system is, or is believed to be, the source of the release.

Confirmed Release No. C-1332-99 and C-1333-99:

During UST removal activities, the source of the engine oil & gasoline releases appeared to be from the associated product piping of Tank No. 9, 10, 12, and 19.

Confirmed Release No. C-1388-99:

During the removal of Tank No. 13, 14, 16, and 18, corrosion holes were observed on the bottom of the tanks. The source of the diesel release is believed to be the tanks.

During Geoprobe® drilling, elevated photoionization detection (PID) readings were detected from soil samples collected in the immediate vicinity of closed-in-place Tank No. 5, 6, 7, and 8. It is unknown what portion of the UST system is the source of the residual oil release.

Confirmed Release No. C-88-00:

Laboratory analytical results from soil samples collected during Geoprobe® drilling in the immediate vicinity of the closed-in-place Tank No. 1, 2, and 3 indicated that elevated contaminate concentrations were detected. It is unknown what portion of the UST system is the source of the diesel release.

C. Describe how the release was discovered.

Confirmed Release No. C-1332-99 and C-1332:

A confirmed release was reported based on stained soils, petroleum odor, and elevated PID readings detected during the removal of Tank No. 9, 10, 12, and 19.

Confirmed Release No. C-1388-99:

A confirmed release was reported based on petroleum odor and elevated PID readings detected during Geoprobe® drilling activities in the immediate vicinity of closed-in-place Tank No. 5, 6, 7, and Tank No. 8, 13, 14, 16, and 18.

Confirmed Release No. C-88-00:

A confirmed release was reported based on the analytical results from soil samples collected during Geoprobe® drilling in the immediate vicinity of closed-in-place Tank No. 1, 2, and 3

D. Describe any tank tightness testing performed in response to this release and provide the date of testing, method of testing, and results of testing.

Not Applicable. Each of the USTs at the subject site were removed or closed-in-place. Therefore, tank tightness testing was not necessary.

E. List all former and existing USTs at the facility.

Tank ID Number (As Registered)	Tank Capacity (gallons)	Contents (Regulated Substance)	Was the tank identified as a LUST?	Has the tank been emptied (Date)?	Has the tank been removed or closed-in-place (Date)?
1	50,000	Diesel	No	Yes, 12/30/99	Closed-in-place, 1/5/00
2	50,000	Diesel	No	Yes, 12/22/99	Closed-in-place, 12/22/99
3	50,000	Diesel	No	Yes, 12/30/99	Closed-in-place, 1/4/00
4	12,000	Gasoline	No	Yes, 12/29/99	Closed-in-place, 1/4/00
5	1,000	Engine Oil	No	Yes, 12/21/99	Closed-in-place, 12/22/99
6	1,000	Engine Oil	No	Yes, 12/21/99	Closed-in-place, 12/22/99
7	1,000	Converter Oil	No	Yes, 12/21/99	Closed-in-place, 12/22/99
8	1,000	Dextron	No	Yes, 1/4/00	Closed-in-place, 1/4/00
9	20,000	Engine Reserves	No	Yes, 12/20/99	Yes, Removed 12/20/99
10	20,000	Engine Reserves	No	Yes, 12/20/99	Yes, Removed 12/20/99
11	1,500	Waste Oil	No	Yes, 12/22/99	Closed-in-place, 12/22/99
12	12,000	Gasoline	No	Yes, 12/21/99	Yes, Removed 12/21/99
14	500	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
15	500	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
16	500	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
17	500	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
18	1,000	Water	No	Yes, 12/22/99	Yes, Removed 12/22/99
19	20,000	Gasoline	No	Yes, 12/23/99	Yes, Removed 12/23/99

F. Describe the initial response actions which were performed at this site, as specified in Sections 21307(2)(a) through (c), and (3)(a) and (b).

In December 1999, during UST closure activities, the site was surveyed for possible fire, explosion, and vapor hazards. No fire, explosion, or vapor hazards were readily observed at the subject site.

2.0 REPORTING AND RESPONSE FOLLOWING THE DISCOVERY OF THE FREE PRODUCT

A. Describe initial response actions performed at this site to address the presence of free product as specified in Sections 21307(2)(c) and (f), and (3)(b) and (c), 21308a (1)(b)(xviii). Refer to the STD Operational Memorandum No. 7, Identification, Reporting, and Recovery of Free Product at LUST Sites.

Not Applicable. Free product has not been encountered at the site.

B. Attach the USTD Free Product Recovery Status Report (EQP 3850).

Not Applicable.

C. Include a schedule for subsequent Free Product Report Submittals.

Not Applicable.

3.0 SITE CHARACTERIZATION INFORMATION

3.1 SCALED SITE MAPS

A. Provide a scaled area map (or maps) which includes the following: site boundaries in relation to the surrounding area and the nearest major roads, location and depth of nearby underground sewers and utility lines; location of nearby surface waters or wetlands, location and screened depth of all off-site wells (municipal, residential, production, irrigation, etc.) within two years groundwater travel time of the property line; and location of all nearby delineated well-head protection areas.

Site boundaries in relation to the surrounding area and the nearest major roads and nearby surface waters are presented on Figure 1, Area Location Map. A water well search within a ½ mile radius of the site was conducted through the MDEQ Lansing office. Results of the water well search indicated that no water well records were located within a ½ mile radius of the subject site. In addition, the City of Detroit ordinance will not allow for the installation of a water supply well.

According to the MDEQ World Wide Web (www) page, a delineated well-head protection area map for Wayne County is currently under preparation and not available at this time.

B. Provide a scaled area map (or maps) which includes the following: location of fill ports, piping, and dispensers, and other pertinent system components for all UST systems currently or formerly at the facility (prior to excavation if tanks have been removed); location of the release and the component of the LUST system from which the release occurred; location of adjacent buildings and roadways, paved areas, or other structures; location of all on-site wells and screened intervals; location of soil and groundwater samples; and excavation dimensions with sample locations.

The location of the UST fill ports are presented on Figure 2. Also illustrated on Figure 2 are the adjacent properties, roadways, paved areas, site buildings, and site structures. Sample locations, UST excavation dimensions, and maximum soil concentrations are presented on Figures 3, 4, and 5.

Upon completion of the installation of monitor wells (as proposed in Section 5.3 C), a maximum groundwater concentration figure will be prepared and presented to the MDEQ in the Final Assessment Report (FAR).

3.2 SCALED CROSS-SECTIONAL DIAGRAMS

A. Provide scaled cross-sectional diagrams of buried utility corridors, including the pipe diameter, the type of backfill, and the trench depth.

Not available at this time. The City of Detroit Water & Sewage Department will be contacted for any available maps depicting the location and depth of buried utility corridors on or near the subject site. If available, a scaled cross-sectional diagram of the buried utility corridors will be prepared and submitted to the MDEQ upon completion of the proposed site investigation (see Section 5.3 C).

B. Provide scaled cross-sectional diagrams depicting the soil lithology and the contaminant distribution, including sampling intervals and boring depths.

A cross-sectional diagram of the soil lithology and contaminant distribution, including sampling intervals and boring depths will be prepared and presented to the MDEQ upon completion of the proposed site investigation (see Section 5.3 C).

C. Provide scaled cross-sectional diagrams depicting the site hydrogeology, including the groundwater potentiometric surface, the monitoring well screened intervals, and sampling intervals.

A cross-sectional diagram of the site hydrogeology, including the groundwater potentiometric surface, monitoring well screened intervals, and sampling intervals will also be prepared and presented to the MDEQ upon completion of the proposed site investigation (see Section 5.3 C).

3.3 SOIL CONDITIONS AND CHARACTERISTICS

A. Describe soil encountered in the vadose zone.

Soil encountered at the site during UST closure and Geoprobe® drilling activities consisted of fill material (brown, fine-grained sand) ranging in depths from 0 to 6 feet below ground (bg). Underlying the fill material was clay ranging in depths from 2 to 16 feet bg, total depth explored. However, in soil borings GP-15, GP-16, GP-18, GP-19, and GP-20 fill material was encountered from 0 to 16 feet bg. Soil boring logs are included in Attachment A.

B. Describe any soil contamination which has been detected.

Closed-In-Place Diesel and Gasoline Aqua System USTs

On January 5, 2000, six soil borings were advanced using a Geoprobe® in the vicinity of the closed-in-place diesel aqua system USTs (Tank No. 1, 2, and 3) and the closed-in-place gasoline aqua system UST (Tank No. 4). These borings are denoted as GP-15, GP-16, GP-18, GP-19, and GP-20 on Figure 3. Laboratory analytical results for soil samples GP-15 (10-12' and 13-15'), GP-16 (7-8' and 10-12'), GP-18 (6-7' and 12-14'), GP-19 (9-7' and 15-16'), and GP-20 (7-8') indicated that lead was detected below the Statewide Default Background Level for lead. Ethylbenzene, xylenes, and 1,3,5-trimethylbenzene (from soil sample GP-18/6-7') and toluene and 1,2,4-trimethylbenzene (from soil samples GP-18/6-7' and GP-18/12-14') were also detected below the Tier I Commercial III RBSLs.

Benzene concentrations from soil sample GP-18 (6-7') were detected above the Tier I Commercial Drinking Water RBSL. Soil analytical data and soil sample locations are presented in Table 2a and on Figure 3, respectively.

A groundwater sample was collected from soil boring GP-20 (Figure 3). Groundwater analytical results indicated that naphthalene and 2-methylnaphthalene were detected below the Tier I Commercial III RBSLs. Groundwater analytical data is presented in Table 4.

Gasoline UST Excavation Area

On December 20, 1999, a total of five soil verification samples were collected from the sidewalls of the gasoline UST (Tank No. 12). These soil samples are denoted as 12 N Sidewall (6'), 12 S Sidewall (6'), 12 E Sidewall (6'), 12 W Sidewall (6'), and 12 SE Sidewall (4') on Figure 3. Groundwater was encountered in the excavation pit. Therefore, a groundwater sample (12 bottom) was collected in place of a bottom soil verification sample. Laboratory analytical results for soil samples 12 N Sidewall (6'), 12 S Sidewall (6'), 12 E Sidewall (6'), and 12 SE Sidewall (4') indicated that lead was detected below the Statewide Default Background Level for lead. However, lead was detected above the Statewide Default Background Level for soil sample 12 W Sidewall (6').

Various volatile organic compounds (VOCs) from soil samples 12 N Sidewall (6'), 12 S Sidewall (6'), 12 E Sidewall (6'), 12 W Sidewall (6'), and 12 SE Sidewall (4') were detected below the Tier I Commercial III RBSLs. The following VOC concentrations were detected above the Tier I Commercial III Drinking Water RBSL: benzene and 1,2,4-trimethylbenzene (from soil samples 12 N Sidewall/6', 12 S Sidewall/6', 12 E Sidewall/6', 12 W Sidewall/6', and 12 SE Sidewall/4'), toluene (from soil samples 12 N Sidewall/6', 12 E Sidewall/6', 12 W Sidewall/6', and 12 SE Sidewall/4'), xylenes and 1,3,5-trimethylbenzene (12 N Sidewall/6', 12 W Sidewall/6', and 12 SE Sidewall/4'), and naphthalene and 2-methylnaphthalene (from soil samples 12 N Sidewall/6' and 12 W Sidewall/6'). Soil analytical results and soil sample locations are presented in Table 2a and on Figure 3, respectively.

Groundwater analytical results for groundwater sample Tank 12 Bottom indicated that 1,1-dichloroethane, 1,2-dibromoethane, and lead were not detected at or above the MDEQ method detection limits. Methyl tert-butyl ether (MTBE) concentrations from Tank 12 Bottom was detected below the Tier I Commercial III RBSLs. However, benzene, toluene, ethylbenzene, and xylenes (BTEX), trimethylbenzenes (TMBs), naphthalene, and 2-methylnaphthalene concentrations were detected above the Tier I Commercial III Drinking Water RBSL. Groundwater analytical results are presented in Table 4. The location of Tank No. 12 is presented on Figure 3.

Aqua Trap USTs Excavation Area

On December 29 and 30, 1999, sixteen soil verification samples were collected in the vicinity of the former aqua trap system (Tanks No. 13, 14, 16, 17, and 18). These soil samples are denoted as 13 S Bottom (8'), 13 N Bottom (8'), 13 S Sidewall (3-4'), 13 W Sidewall (3-4'), 14 S Bottom (8'), 14 N Bottom (8'), 16 S Bottom (8'), 16 N Bottom (8'), 16 S Sidewall (4-6'), 16 N Sidewall (2-3'), 17 S Bottom (8'), 17 N Bottom (8'), 18 E Bottom (8'), and 18 W Bottom (8') on Figure 3. Laboratory analytical results for each of the sixteen soil samples indicated that lead was detected below the Statewide Default Background Level for lead.

Various polynuclear aromatics hydrocarbons (PNAs) were detected below the Tier I Commercial III RBSLs from soil samples 13 S Sidewall (3-4'), 13 W Sidewall (3-4'), 16 S Sidewall (4-6'), 16 N Sidewall (2-3'), 17 S Bottom (8'), 17 N Bottom (8'), 18 S Sidewall (6-8'), and 18 N Sidewall (18"). However, laboratory results indicated that from soil sample 13 W Sidewall (3-4') naphthalene was detected above the Tier I Commercial III Drinking Water RBSL.

Various VOCs were detected below the Tier I Commercial III RBSLs from soil samples 13 S Sidewall (3-4'), 13 W Sidewall (3-4'), 14 S Bottom (8'), 14 N Bottom (8'), 16 S Bottom (8'), 16 N Bottom (8'), 16 S Sidewall (4-6'), 16 N Sidewall (2-3'), 17 S Bottom (8'), 17 N Bottom (8'), 18 E Bottom (8'), and 18 W Bottom (8'). The following VOCs were detected above the Tier I Commercial III Drinking Water RBSL: benzene (from soil samples 13 S Sidewall/3-4', 13 W Sidewall/3-4', 16 S Sidewall/4-6', and 18 S Sidewall/6-8'), ethylbenzene and TMBs (from soil samples 13 S Sidewall/3-4', 13 W Sidewall/3-4', 16 S Sidewall/4-6', 16 N Sidewall/2-3', and 18 S Sidewall/6-8'), xylenes

(from soil samples 13 S Sidewall/3-4' and 16 N Sidewall/2-3'), naphthalene (from soil sample 13 S Sidewall/3-4'), and 2-methylnaphthalene (from soil samples 13 S Sidewall/2-3' and 16 S Sidewall/4-6'). Soil analytical data and soil sample locations are presented in Table 2a and on Figure 3, respectively.

Closed-In-Place Waste Oil UST

On December 30, 1999, four soil verification samples were collected in the vicinity of the closed-in-place waste oil UST (Tank No. 11). These soil samples are denoted as 11 S Bottom (11-12'), 11 N Bottom (10-11'), 11 S Sidewall (7-8')/GP-9, and 11 S Bottom (11-12')/GP-9 on Figure 4. Based on visual and PID readings, two of the four soil samples (11 S Bottom/11-12') and 11 N Bottom/10-11') were submitted for laboratory analysis. Laboratory analytical results for each of the two soil samples indicated that VOCs, PNAs, and polychlorinated biphenyls (PCBs) were not detected at or above the MDEQ method detection limits. Cadmium, chromium, and lead were detected below the Tier I Commercial III RBSLs for each of the two soil samples. Soil analytical data and soil sample locations are presented in Table 2a and on Figure 4, respectively.

Closed-In-Place Engine Oil, Converter Oil, and Dextron USTs

On December 30, 1999, and January 5, 2000, nine soil verification samples were collected using a Geoprobe® in the vicinity of the closed-in-place engine oil USTs, converter oil UST, and dextron UST (Tank No. 5, 6, 7, and 8). These soil samples are denoted as 5 N Sidewall (4-6'), 5 Bottom (10-11'), 6 N Sidewall (4-6'), 6 Bottom (9-11'), 7 N Sidewall (2-3'), 7 N Sidewall (6-7'), 7 Bottom (10-11'), 8 N End (2-3'), and 8 N End (10-11') on Figure 3. Laboratory results for soil samples 5 N Sidewall (4-6'), 7 N Sidewall (6-7'), 7 Bottom (10-11') indicated that TMBs were detected below the Tier I Commercial III RBSLs. However, TMBs for soil samples 6 N Sidewall (4-6'), 6 Bottom (9-11'), 7 N Sidewall (2-3'), and 8 N End (2-3') were detected above the Tier I Commercial III Drinking Water RBSL.

Various PNAs for soil samples 5 N Sidewall (4-6'), 6 N Sidewall (4-6'), 6 Bottom (9-11'), 7 N Sidewall (2-3'), 7 N Sidewall (6-7'), 7 Bottom (10-11'), 8 N End (2-3'), and 8 N End (10-11') were detected below the Tier I Commercial III RBSLs. Naphthalene and 2-methylnaphthalene were detected above the Tier I Commercial III Drinking Water RBSL for soil samples 7 N Sidewall (2-3') and 8 N End (2-3'). Soil analytical and soil sample locations are presented in Table 2b and on Figure 3, respectively.

Engine Oil and Gasoline Reserve UST Excavation Area

On December 20 and 23, 1999, seventeen soil verification samples were collected in the vicinity of the two engine oil reserve USTs (Tank No. 9 and 10), the gasoline reserve UST (Tank No. 19), and the associated UST piping. These soil samples are denoted as 9 E Bottom (14'), 9 W Bottom (14'), 9 E Sidewall (8'), 9 W Sidewall (18'), 9 SE Sidewall (10'), 9 SW Sidewall (4'), 10 E Bottom (14'), 10 W Bottom (14'), 10 E Sidewall (6'), 10 W Sidewall (8'), Pipe Run (3'), 19 E Bottom (14'), 19 W Bottom (14'), 19 E Sidewall (8'), 19 W Sidewall (8'), 19 NE Sidewall (8.5'), and 19 NW Sidewall (9') on Figure 5. Laboratory results for soil samples E Bottom (14'), 9 W Bottom (14'), 9 E Sidewall (8'), 9 W Sidewall (18'), 9 SE Sidewall (10'), 9 SW Sidewall (4'), 10 E Bottom (14'), 10 W

Sidewall (8'), 19 E Bottom (14'), 19 W Bottom (14'), 19 E Sidewall (8'), 19 W Sidewall (8'), 19 NE Sidewall (8.5'), and 19 NW Sidewall (9') were detected below the Statewide Default Background Level for lead. For soil samples 10 W Bottom (14'), 10 E Sidewall (6'), and Pipe Run (3'), lead was detected above the Tier I Commercial III Drinking Water RBSL.

Various PNAs were detected below the Tier I Commercial III RBSLs for soil samples 9 E Sidewall (8'), 9 W Sidewall (10'), 10 W Bottom (14'), 10 E Sidewall (6'), Pipe Run (3'), 19 E Sidewall (8'), and 19 NE Sidewall (8.5'). In addition, various VOCs were detected below the Tier I Commercial III RBSLs for soil samples E Bottom (14'), 9 W Bottom (14'), 9 E Sidewall (8'), 9 W Sidewall (18"), 9 SE Sidewall (10'), 9 SW Sidewall (4'), 10 W Bottom (14'), 10 E Sidewall (6'), 10 W Sidewall (8'), Pipe Run (3'), 19 E Sidewall (8'), and 19 NW Sidewall (9'). However, the following VOCs were detected above the Tier I Commercial III Drinking Water RBSL: benzene (from soil samples 9 E Sidewall/8', 9 W Sidewall/10', 10 W Bottom/14', 10 E Sidewall/6', 10 W Sidewall/8', and 19 E Sidewall/8'), toluene (from soil samples 10 W Bottom/14' and 19 E Sidewall/8'), ethylbenzene (from soil samples 9 E Bottom/14', 9 W Bottom/14', 10 W Bottom/14', and 19 E Sidewall/8'), xylenes (from soil samples 10 W Bottom/14' and 19 E Sidewall/8'), and TMBs (from soil samples 9 W Bottom/14', 9 W Sidewall/18", 10 W Bottom/14', 10 E Sidewall/6', and 19 E Sidewall/8'). Soil analytical results and soil sample locations are presented in Table 2a and on Figure 3, respectively.

C. Describe any soil remediation or disposal activities performed to date, including the volume of soil remediated or disposed. Indicate the disposal location, and provide proof of disposal (e.g., invoices, not load tickets).

Approximately 1,020 cubic yards of impacted soil were excavated and disposed at Browning-Ferris Industries (BFI) located at Arbor Hills Landfill 10930 Six Mile Road in Northville, Michigan. Manifests are included in Attachment B.

D. Provide a site diagram which identifies the estimated horizontal and vertical extent of on-site and off-site soil contamination. Include the maximum concentrations and sample depths.

Maximum soil concentrations are presented on Figures 3, 4, and 5. Figure 3 depicts sample locations in the vicinity of the closed-in-place diesel aqua system USTs (Tank No. 1, 2, and 3), the closed-in-place gasoline aqua system UST (Tank No. 4), closed-in-place engine oil USTs (Tank No. 5 and 6), the closed-in-place converter oil UST (Tank No. 7), and the closed-in-place dextron UST (Tank No. 8), and the gasoline UST (Tank No. 12). Figure 4 depicts sample locations in the vicinity of the closed-in-place waste oil UST (Tank No. 11). Figure 5 depicts sample location in the vicinity of the engine oil reserve USTs (Tank No. 9 and 10) and the gasoline reserve UST (Tank No. 19).

E. Provide an estimate of the volume of impacted soil remaining in the vadose zone.

An estimate of the volume of impacted soil remaining in the vadose zone will be determined upon completion of the proposed site investigation, as summarized in Section 5.3 C.

F. Describe steps that have been taken, or will be taken, to secure access to off-site properties, including easements and right-of-ways, to complete the delineation of the extent of the off-site impact of the release to soil. Include the names and addresses of potentially affected off-site property owners.

At this time, off-site access has not been solicited. In order to delineate the extent of the plume north of the subject property (commercial property), off-site access will be pursued.

G. Provide the schedule for completing the delineation of the extent of the off-site impact of the release to the soil.

Based on the results of the UST closure activities, the extent of the off-site impact of the release to the soil will be investigated. The scope of work and schedule for the proposed off-site plume delineation investigation are summarized in Section 5.3 C.

H. Provide a table with field screening and laboratory data showing the results of all soil sampling performed to date for the required parameters. Refer to the STD Operational Memorandum No. 14 (Analytical Parameters and Methods, Sample Handling, and Preservation for Petroleum Releases).

Field screening results for soil are presented in Table 1. Soil analytical data is presented in Tables 2a and 2b. The following analytical parameters were used:

Leaded Gasoline Parameters

Soil samples collected in the vicinity of the gasoline UST (Tank No. 12), the gasoline aqua system UST (Tank No. 4), and the gasoline reserve UST (Tank No. 19) were submitted for laboratory analysis of benzene, toluene, ethylbenzene, and xylenes (BTEX), methyl tert-butyl ether (MTBE), 1,2,4-trimethylbenzene and 1,3,5-trimethylbenzene (TMBs), 1,2-dibromoethane, 1,2-dichloroethane, naphthalene, and 2-methylnaphthalene by U.S. EPA Method 8260 and lead by U.S. EPA Method 6010 (Table 2a).

Residual Oil Parameters

Soil samples collected in the vicinity of the closed-in-place engine oil USTs (Tank No. 5 and 6), the closed-in-place converter oil UST (Tank No. 7), the closed-in-place dextron UST (Tank No. 8) and the engine oil reserve USTs (Tank No. 9 and 10) were submitted for laboratory analysis of TMBs by U.S. EPA Method 8260 and PNAs by U.S. EPA Method 8310 (Table 2a).

Light Distillate Oil Parameters

Soil samples collected in the vicinity of the closed-in-place diesel aqua system USTs (Tank No. 1, 2, and 3) were submitted for laboratory analysis of BTEX and TMBs by U.S. EPA 8260 and PNAs by U.S. EPA Method 8310 (Table 2a).

Waste Oil Parameters

Soil samples collected in the vicinity of the closed-in-place waste oil UST (Tank No. 11) excavation were submitted for laboratory analysis of volatile halocarbons (includes BTEX, TMBs, 1,2-dibromoethane, 1,2-dichloroethane) by U.S. EPA Method 8260, PNAs by U.S. EPA Method 8310, PCBs by U.S. EPA Method 8082 and cadmium, chromium, and lead by U.S. EPA Method 6010 (Tables 2b and 2c).

I. Provide a table which compares the maximum remaining soil contaminant concentrations for each required parameter to the appropriate RBSLs as provided in STD Operational Memorandum No. 4 (Tier I Lookup Tables for Risk-Based Corrective Action at Leaking Underground Storage Tank Sites). If residential leaching to groundwater RBSLs are not utilized for comparison, provide an explanation.

A soil comparison table is presented in Table 3. Commercial III leaching to groundwater RBSLs were utilized based on the land use and zoning of the site.

J. Provide soil boring logs.

Soil boring logs generated during Geoprobe® drilling activities are included in Attachment A.

K. Identify any known soil contamination not related to the release and the source, if known.

Not Applicable.

3.4 GROUNDWATER CONDITIONS AND CHARACTERISTICS

A. Describe the site hydrogeology, and include: depth to groundwater and method of determination; whether the groundwater is potable and/or not in an aquifer, provide the basis for this determination (Refer to STD Operational Memorandum No. 11, Criteria to Eliminate the Potable Groundwater Pathway); whether the groundwater is currently used as a source of drinking water, either residential or municipal; whether groundwater is being used for a purpose other than drinking water; whether more than one groundwater unit is present beneath the site; depth to bottom of water-bearing layer; predominant soil type in water-bearing stratum (e.g., sand, silt); effective porosity of water-bearing stratum (in $\text{cm}^3 \text{ void} / \text{cm}^3 \text{ matrix}$), and describe how it was determined; hydraulic conductivity, and describe how it was determined; groundwater flow rate and direction; lateral component of the hydraulic gradient; hydrogeologic conditions that could influence flow direction; and magnitude and direction of the vertical component of the hydraulic gradient.

At this time, an insufficient amount of groundwater characterization data is available to appropriately compare site data to the MDEQ storage tank division (STD) Operational Memorandum No. 11 (dated August 25, 1997) to determine whether the potable water pathway can be eliminated. Therefore, in this report, site data were compared to the MDEQ Drinking Water RBSLs. As summarized in Section 5.3 C of this report, the proposed site investigation will provide the additional data necessary to characterize the groundwater and evaluate the potable groundwater pathway. The proposed site investigation will include determining the effective porosity of the water-bearing stratum, the hydraulic conductivity, the groundwater flow rate and direction, the lateral component of the hydraulic gradient, and the magnitude and direction of the vertical component of the hydraulic gradient.

Based on the results of the water well log search conducted through the MDEQ water well log division in Lansing, there is no evidence that groundwater is being used as a source of drinking water at the site or in the vicinity of the site. It is unknown whether more than one groundwater unit is present beneath the site and the depth to the bottom of the water-bearing layer is unknown. The predominant soil type encountered in the shallow perched groundwater zone was sand (fill material).

B. Attach copies of the following: boring logs, well construction diagrams, potentiometric surface map, and elevation data (USGS datum preferred), including top-of-casing, and grade elevations, and depth to groundwater.

Soil boring logs are included in Attachment A. Upon completion of the proposed site investigation (summarized in Section 5.3 C), a potentiometric surface map and an elevation data table will be submitted to the MDEQ.

C. Provide scaled maps and cross-sectional diagrams, showing the screened and/or sampling interval, which depict the extent of impact and the maximum concentrations.

Maximum groundwater concentrations, sample intervals, and cross-sectional diagrams will be prepared and submitted to the MDEQ upon completion of the proposed site investigation activities (Section 5.3 C).

D. Indicate whether more than one groundwater unit has been impacted.

More than one groundwater unit has not been encountered at the site.

E. Describe any groundwater remediation activities performed to date, including the total volume of groundwater remediated and the disposition of this groundwater.

No groundwater remediation activities were performed to date at the site.

F. Provide an indication of whether the plume currently extends off-site.

At this time, it is unknown whether the plume extends off-site. Delineation of the extent of plume will be investigated as proposed in Section 5.3 C. Results of the investigation will be presented to the MDEQ.

G. Describe steps that have been taken, or will be taken, to secure access to off-site properties, including easements and right-of-ways, for the purpose of completing the delineation of the extent of the release to groundwater, and provide the names and addresses of off-site property owners.

Verification of whether the plume extends off-site, along the northern property boundary, will be determined upon completion of the proposed site investigation activities summarized in Section 5.3 C. If the results of the site investigation indicate the plume extends off-site, then action will be taken to secure off-site access.

H. Provide the schedule for completing the delineation of the extent of the off-site impact of the release to groundwater.

Upon completion of the proposed site investigation (Section 5.3 C) and review of the results, off-site access will be pursued. Off-site delineation will begin as soon as off-site access is granted. Delineation of the plume is scheduled to be completed prior to the submittal of the Final Assessment Report for this site.

I. Provide a table with field screening and laboratory data showing the results of all groundwater sampling performed to date for the required parameters. Refer to the STD Operational Memorandum No. 14.

A field screening table for groundwater is not available. Laboratory analytical results for groundwater are presented in Table 4. A comparison table for maximum concentrations in groundwater to the Tier I Commercial III RBSLs is presented in Table 5.

3.5 CONDITIONS AND CHARACTERISTICS IN OTHER ENVIRONMENTAL MEDIA

A. Describe the evaluations conducted to determine if other environmental media have been impacted.

Not Applicable. It is not deemed necessary, at this time, for other environmental media to be investigated.

4.0 SITE CLASSIFICATION

A. Indicate the current Site Classification Level, in accordance with STD Operational Memorandum No. 5, Leaking Underground Storage Tank (LUST) Site Classification System.

In accordance with the STD Operational Memorandum No. 5, LUST Site Classification System, the current site classification level is Class 3.

B. Provide a justification for this classification. Identify the current conditions that are the basis of the classification, and dates that the prescribed initial response actions were implemented.

This classification is appropriate based on soil concentrations detected above the MDEQ Tier I Commercial III Drinking Water RBSLs. Response actions were implemented on December 20, 1999.

5.0 RESULTS OF THE RBCA EVALUATION

5.1 EXPOSURE PATHWAY CHARACTERIZATION

A. Identify and describe the potentially applicable Exposure Scenarios:

<i>Exposure Scenarios</i>	<i>Exposure Pathway Characterization</i>
<i>Potential Source(s)</i>	- Impacted Soils - Dissolved Groundwater Plume
<i>Potential Transport Mechanism(s)</i>	- Volatilization and Atmospheric Dispersion - Volatilization and Enclosed-Space Accumulation - Utility Corridors - Leaching and Groundwater Transport
<i>Potential Exposure Route(s)</i>	- Soil Ingestion - Direct Contact of Soil with Skin - Inhalation of Volatiles - Direct Contact with Groundwater
<i>Potential Receptor(s)</i>	- Construction Worker - Commercial Worker - Structures - Utilities

Exposure pathways for groundwater will be evaluated during the proposed site investigation activities (see Section 5.3 C). Upon completion of the investigation, results will be presented to the MDEQ.

B. List each possible exposure pathways for each land use, and sensitive habitat for the site. Provide an explanation for eliminating any pathways.

Residential Exposure Pathways: The subject property land use and zoning is commercial. No residential construction exists on, near, or will be approved for, this location. No residential receptors are known to exist; therefore, this pathway is incomplete.

Commercial Exposure Pathways: The most plausible potential commercial exposure pathway for the site is direct contact with soil or groundwater during construction activities such as excavation, utility repair, etc.

Industrial Exposure Pathways: No industrial receptors are known to exist; therefore, the pathway is incomplete.

Sensitive Habitat Exposure Pathways: No sensitive habitat receptors are known to exist; therefore, the pathway is incomplete.

5.2 OPTIONAL TIER II EVALUATION

A. Indicate whether a site-specific Tier II or evaluation has been conducted for this site.

At this time, a site-specific Tier II evaluation is not necessary. Therefore, it has not been conducted for this site.

B. If applicable, identify and justify where alternate assumptions or site-specific information were used in place of the default assumptions as defined in the USTD Operational Memorandum No. 4.

Not applicable.

C. Provide the calculations and reference citations supporting the development of the relevant Tier II SSTLs.

Not applicable.

D. Provide a table which compares the maximum remaining contaminant concentrations for each required parameter for all media to the appropriate RBSLs (as provided in the STD Operational Memorandum No. 4), and the calculated SSTLs. Identify all applicable land use scenarios, and indicate whether or not there is an exceedance of the RBSLs or the SSTLs.

Not applicable.

5.3 PROPOSED FOLLOW-UP ACTIVITIES

A. Based on the results of the Tier I or Tier II evaluation, indicate the follow-up activities proposed for the site (e.g., site closure interim corrective action with subsequent reevaluation; final corrective action to achieve Tier I RBSLs or Tier II SSTLs; or perform further site-specific Tier II or Tier III evaluation to establish alternative SSTLs that meet the target risk goals).

The proposed interim corrective actions will initially begin with an on-site investigation to delineate soil and groundwater impact and determine the groundwater characteristics and conditions at the site. In addition, the on-site investigation will provide data to determine whether the plume extends off-site. If results indicate that the plume extends off-site, off-site access will be pursued. Upon approval of off-site access, an investigation will be conducted off-site to delineate the extent of the plume and evaluate off-site conditions. Results of the proposed investigation will be presented in the Final Assessment Report (FAR).

B. Provide justification for the option chosen.

Based on the results of the soil verification samples collected during UST closure activities, the extent of soil and groundwater impact and the groundwater conditions at the site have not been completely defined in order to evaluate the appropriate remedial action or closure options for the site. Therefore, site conditions will be further evaluated from data collected during the proposed site investigation activities (see Section 5.3 C). As indicated in Section 5.3 A, the results of the proposed site investigation will be presented in the FAR.

C. Provide a Work Plan and implementation schedule that describes the proposed site characterization activities to be performed to determine the horizontal and vertical extent of contamination. Include a scaled site map depicting proposed sampling locations.

Purpose

The purpose of this proposed site investigation is to present sufficient data to define the extent of soil and groundwater impact identified during the UST closure activities. In addition, this proposed site investigation will provide data to determine the characteristics and conditions of the soil and groundwater and to evaluate the potential exposure pathways. The proposed site investigation activities are summarized in detail below.

Drilling and Sampling Activities

Prior to conducting drilling activities, underground utilities will be located and documented. In addition, the City of Detroit Water & Sewage Department will be contacted for any available maps depicting the location and depth of buried utility corridors.

To adequately define the extent of soil and groundwater impact at the site, a total of seventeen soil borings are proposed to be advanced. Proposed boring locations are presented on Figures 6A and 6B. The location and number of borings selected was established based on the analytical results from samples collected during the UST closure activities. The final locations of these borings may be altered due to conditions encountered in the field during drilling activities.

Proposed soil borings will be advanced using a Geoprobe® truck-mounted drill rig. Geoprobe® drilling will be performed using two-inch stainless steel probes that will be hydraulically driven. Soil samples will be collected continuously using a macro core sampling device, which provides a four-foot long sample encapsulated in a clear acetate sleeve. Soil borings will be advanced to a maximum depth of 20 feet bg. However, if significant contamination is present at this depth, the borings will be advanced beyond 20 feet bg to determine the approximate vertical extent of contamination.

Upon retrieval to the surface, soil samples will be visually inspected, classified geologically, and field screened with an organic vapor meter (OVM) equipped with a photoionization detector (PID). The soil samples exhibiting the maximum visual, olfactory, or PID evidence of contamination from each boring will be selected for laboratory analysis. If all soil samples from a soil boring exhibit minimal visual, olfactory, or PID evidence of contamination, then the soil sample collected approximately two to four feet above the water table will be selected for analysis. In addition, the boring terminus sample will be collected to define the approximate vertical extent of contamination.

Soil samples collected for laboratory analysis will be preserved with methanol, labeled, and stored on ice in a cooler. Proper chain-of-custody procedures will be followed. Soil samples will be submitted to the laboratory for the following analyzes and parameters:

- In the vicinity of the closed-in-place waste oil UST (Tank No. 5), soil samples will be submitted for laboratory analysis of BTEX, TMBs, 1,2-dichloroethane, 1,2-dibromoethane, and volatile halocarbons by U.S. EPA Method 8260, PNAs by U.S. EPA Method 8310, cadmium, chromium, and lead by U.S. EPA Method 6010, and PCBs by U.S. EPA Method 8082. These parameters are required by the MDEQ for the previous storage of waste oil at a site.
- In the vicinity of the former gasoline UST (Tank No. 12), the former gasoline reserve UST (Tank No. 19), the closed-in-place gasoline aqua system UST (Tank No. 4), the closed-in-place diesel aqua system USTs (Tank No. 1, 2, and 3), and the former aqua system trap USTs (Tank No. 13, 14, 16, 17, and 18), soil samples will be submitted for laboratory analysis of BTEX, MTBE, TMBs, 1,2-dichloroethane, 1,2-dibromoethane, naphthalene, and 2-methylnaphthalene by U.S. EPA Method 8260, and PNAs by U.S. EPA Method 8310. These parameters are required by the MDEQ for the previous storage of gasoline and diesel.

- In the vicinity of the closed-in-place engine oil USTs (Tank No. 5 and 6), the closed-in-place converter oil UST (Tank No. 7), and the closed-in-place dextron UST (Tank No. 8), soil samples will be submitted for laboratory analysis of TMBs by U.S. EPA Method 8260 and PNAs by U.S. EPA Method 8310. These parameters are required by the MDEQ for the previous storage of residual oils at a site.

Field Standard Operating Procedures (SOPs) for Geoprobe® and HSA drilling, Quality Assurance/Quality Control (QA/QC) sampling, decontamination procedures, and health and safety plans are included in Attachment C.

Monitoring Well Installation

Based on the soil and groundwater conditions encountered during Geoprobe® drilling, approximately eight of the seventeen proposed soil borings will be completed as permanent monitoring wells (Figures 6A and 6B) to monitor groundwater concentrations at the site. In borings not completed as permanent monitor wells, a groundwater sample will be collected from the boring prior to abandonment. The monitor wells will be installed using a hollow stem auger (HSA) drill-rig. Drilling will be performed using a ¼ -inch inner diameter (ID) HSA.

Monitor wells will be constructed of two-inch ID polyvinyl chloride (PVC) materials, with a screen length of five feet. Screens will be of the machine slotted type, and the slot size will be 0.010 inches. Wells will be installed such that the screened interval is straddling the water table. The approximate depth will be determined in the field during drilling. The wells will be sealed with expandable locking caps and finished with flush mounted protective covers set in concrete.

The annular space around the wells will be packed with silica filter sand from the bottom of the screen to approximately one foot above the screen, followed by a one-foot thick bentonite seal. The remaining annular space will be filled with either bentonite chips or cement grout to the concrete pad. Locking water tight well caps will be placed on each well and flush-mounted, traffic-rated, steel protective covers will be set in concrete and installed to prevent unauthorized access and for the protection of the monitoring well.

After the wells are installed, each well will be developed by a combination of appropriate techniques, including bailing, surging, jetting, or pumping to ensure maximum communication with the aquifer across the screened interval. Each well (top of casing) will be surveyed to the nearest 0.01 foot to allow for groundwater flow direction calculations.

SOPs for monitoring well installation, well development, and well purging are included in Attachment C.

Groundwater Sampling

Groundwater samples will be collected from the newly installed monitor wells a minimum of 24 hours after development. Upon opening the each monitor well cap, the depth to water will be measured from the top of each well casing and recorded to the nearest 0.01 foot. This will provide data for calculating the volume of water to purge and for calculating the groundwater flow direction and gradient.

Prior to collecting groundwater samples from each of the newly installed monitor wells, three wetted-casing volumes of groundwater will be purged from the well. The purging will remove stagnant water from the well casing, ensuring that the sample is representative of the groundwater at the screened interval of the well. After purging, a groundwater sample will be collected using a new disposable polyethylene bailer with new bailer cord. Groundwater samples will be placed in appropriately preserved sample containers provided by the laboratory. Samples collected for dissolved lead analysis will be field-filtered through a 0.45-micron filter prior to collection. Once groundwater samples have been collected, samples will be stored on ice in a cooler and submitted to the laboratory. Proper chain-of-custody procedures will be followed. Groundwater samples will be submitted for the same analytical parameters as the soil samples, described above.

SOPs for groundwater sampling and QA/QC control sampling are included in Attachment C.

Hydrogeologic Characteristics Determination

The newly installed monitor wells will be surveyed to provide data for calculating the groundwater elevation for determining the groundwater flow direction. Survey measurements will be obtained from the north side of the top of each well casing. An assigned elevation of 100 feet will be used as a temporary benchmark. The survey data will be combined with the static water level measurements obtained during the groundwater sampling activities. A table presenting the groundwater elevation and a groundwater contour map will be presented to the MDEQ in a Quarterly Groundwater Monitoring Report.

Hydraulic conductivity testing will be performed on select monitor wells to characterize the hydraulic properties of the site's water-bearing zone. The hydraulic conductivity will be calculated with an equation based on the research of Bouwer and Rice, 1976 (Bouwer and Rice). Other hydrogeologic parameters, such as groundwater velocity and hydraulic gradient, will also be determined.

Off-Site Plume Delineation Investigation

If results from the proposed on-site investigation indicate that the plume extends off-site onto the Grand Trunk Railroad property (located southeast of the site), then off-site access will be pursued. Upon approval of off-site access, the extent of the plume will be investigated. The number of soil borings/monitoring wells to be installed off-site will be based on the results of the on-site investigation.

Report Preparation

Groundwater sampling from the newly installed monitor wells will be conducted on a quarterly basis. Results of the groundwater sampling activities will be presented to the MDEQ in a Quarterly Groundwater Monitoring Report. This report will also include groundwater elevation data and a groundwater contour map.

Results of the proposed site investigation activities will be included in a Final Assessment Report (FAR). This report will be submitted to the MDEQ and include a detailed description of the work completed at the site, an interpretation of the data, an evaluation of potential exposure pathways, and a feasibility analysis. If the investigation and quarterly groundwater monitoring results indicate that the site can be closed without further remediation and/or monitoring, a Closure Report will be submitted in lieu of the FAR.

Schedule

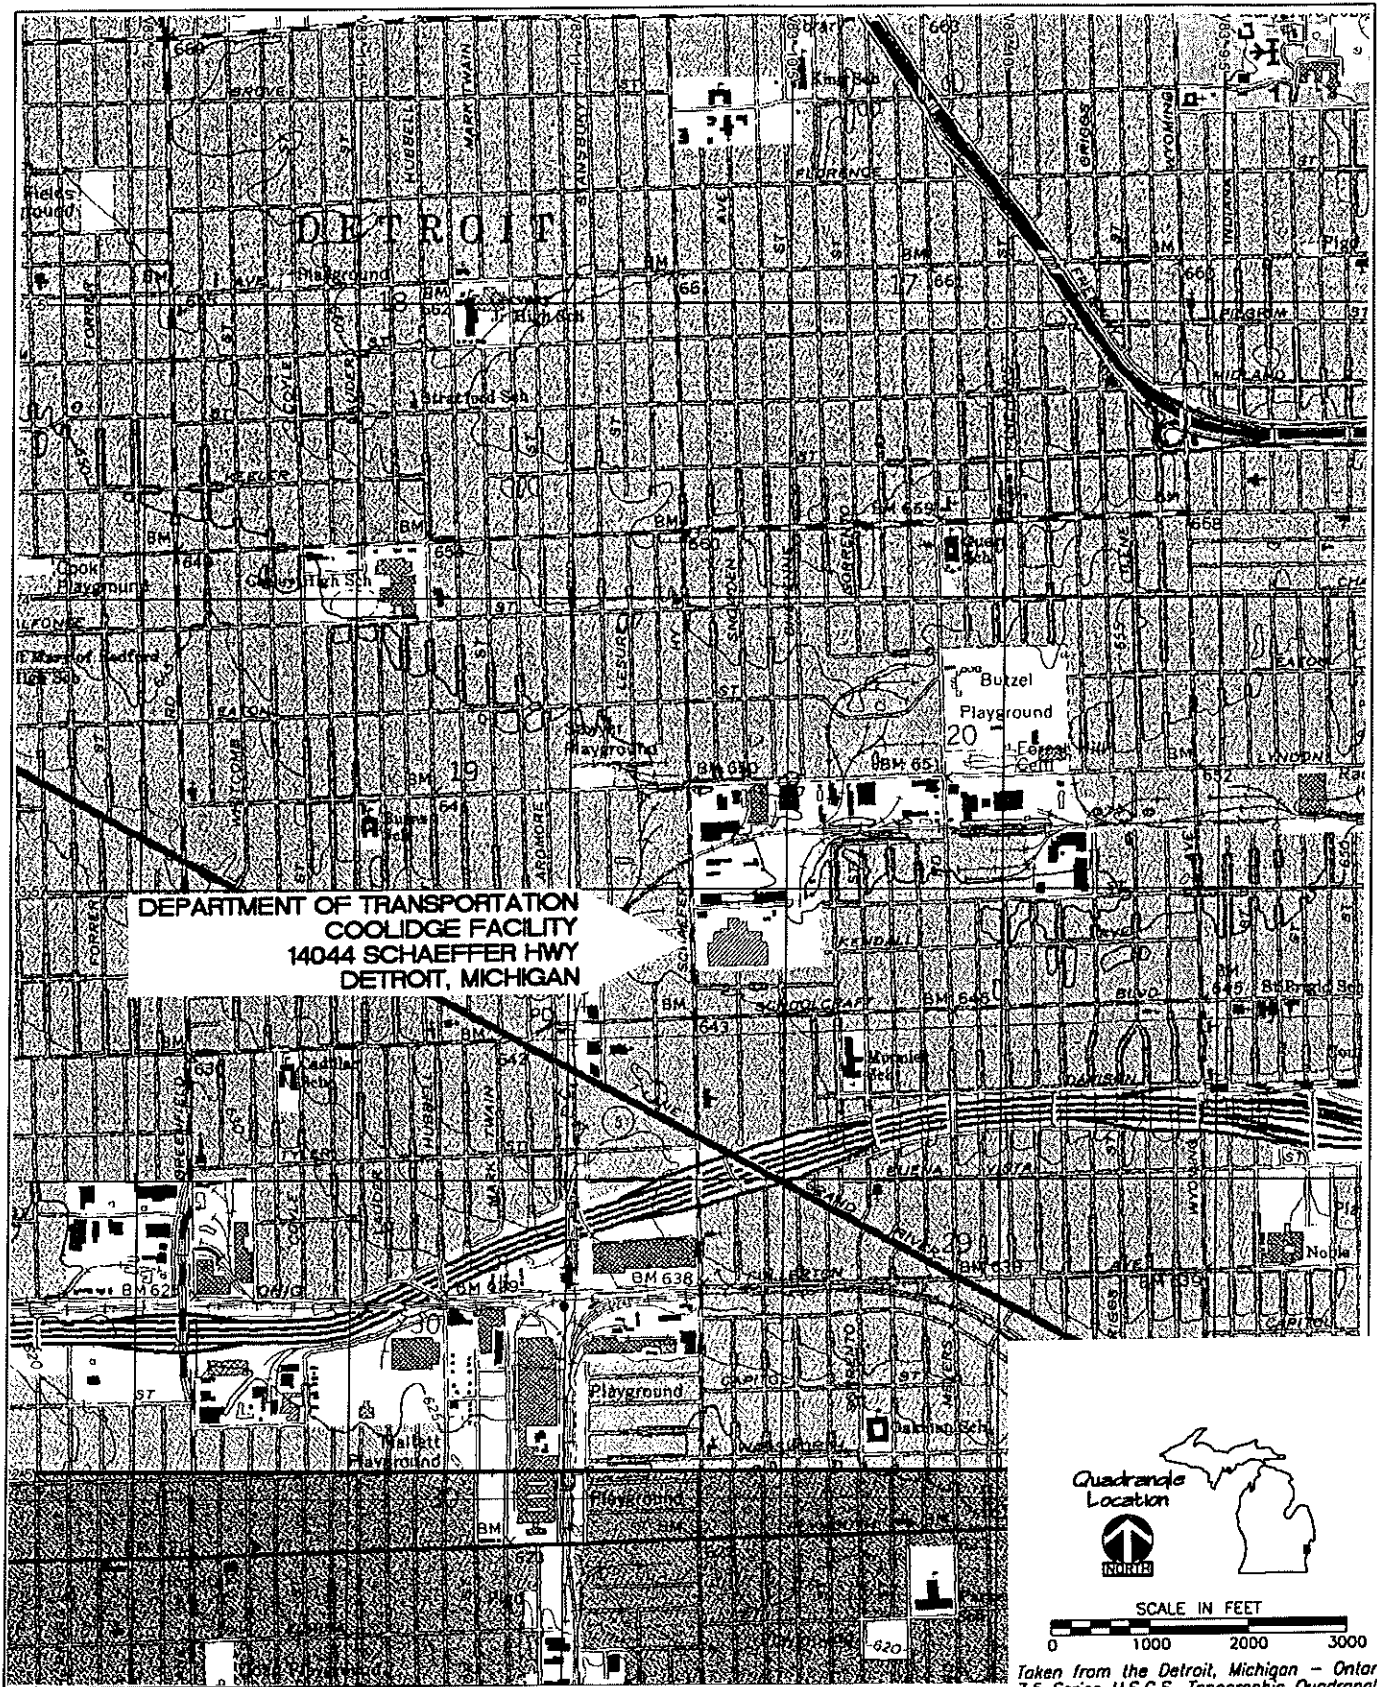

The proposed on-site investigation activities are tentatively scheduled to begin in May 2000. Based on the results of the on-site investigation, verification of whether the plume extends off-site will be determined. If results indicate that the plume extends off-site, then off-site plume delineation will be conducted. Groundwater concentrations will be monitored on a quarterly basis after initial installation and sampling. Prior to initiating field activities, the MDEQ will be notified a minimum of 48-hours.

Since the FAR is required to be submitted to the MDEQ-STD within 365 days after a release has been discovered, a FAR for this site will be prepared and submitted to the MDEQ-STD in December 2000.

Background, as defined in Rule 239 5701(c), may be substituted if higher than cleanup criterion. DeCalculated criterion exceeds 100%; hence, it is reduced to 100% (i.e., 1.0E+9 ppb). GSI value is pH or water hardness dependent. MeCalculated criterion is below the analytical method detection limit (MDL); therefore, the criterion defaults to the MDL. NR=The GSI criterion shown is not protective for surface water that is used as a drinking water source. ID=Inadequate data to develop criterion. IP=Development of criteria is not available or, as is the case for Csat, not applicable. NLL=Chemical is not likely to be found in soil. NLV=Chemical is not likely to volatilize under most conditions. NR = Analysis not requested.

B=Background, as defined in Rule 289.5701(6), may be substituted if higher than cleanup criterion. D=Calculated criterion exceeds 100%; hence, it is reduced to 100% (i.e., 1.0E+9 ppb). G=GS1 value is pH or water hardness dependent. M=Calculated criterion is below the analytical method detection limit (MDL); therefore, the criterion defaults to the MDL. X=The GS1 criterion shown is not protective for surface water that is used as a drinking water source. D=Inadequate data to develop criterion. IP=Development of criteria in process. NA=Criterion or value is not available or, as is the case for Cs-137, not applicable. NLL=Chemical is not likely to leach under most soil conditions. NLV=Chemical is not likely to volatilize under most conditions. NR = Analysis not requested.

B=background, as defined in Rule 299.5701(c), may be substituted if higher than cleanup criterion. D=Calculated criterion exceeds 100%; hence, it is reduced to 100% (i.e., 1.0E+9 ppb). G=GSI value is pH or water hardness dependent. M=calculated criterion is below the analytical method detection limit (MDL); therefore, the criterion defaults to the MDL. X=The GSI criterion shown is not protective for surface water that is used as a drinking water source. ID=Inadequate data to develop criterion. IP=Development of criteria in process. NA=Criterion or value is not available or, as is the case for Csat, not applicable. NLL=Chemical is not likely to leach under most soil conditions. NLV=Chemical is not likely to volatilize under most conditions. T=Refer to the Toxic Substances Control Act (TSCA), 40 CFR 761, Subparts D and G, as amended to determine the applicability of TSCA cleanup standards.

Notes:

1. ND = Not detected at or above the MDEQ method detection limits.
2. NA = Not applicable
3. ** = Criterion not published to date by the MDEQ.
4. Exposure Codes:
 A = Industrial and Commercial Drinking Water Protection RBSL
 B = Commercial III Direct Contact
 C = Soil Volatilization to Indoor Air Inhalation RBSL
 D = Infinite Source Volatile Soil Inhalation RBSL (VSIC)
 E = Statewide Default Background Level
5. Shaded values represent exceedence of the most stringent applicable cleanup criteria.

3. 12/30/99, and 4. 1/25/00

CONFIRMED RELEASE NUMBER(S): 1. C-1332-99,
2. C-1333-99, 3. C-1388-99, and 4. C-88-00

O/O NAME: City of Detroit

O/O STREET ADDRESS: 5300 Chrysler Service Drive

STATE: MI

ZIP CODE: 48211

CONTACT PERSON: Ken Ong

PHONE NUMBER: 313.833.3000

ANSWER ALL QUESTIONS

1. Type(s) of product released: Diesel

2. Free product present:

a. Currently? YES NO

If YES, total gallons recovered since last report: 1.53

b. Previously? YES NO

If YES, total gallons recovered to date: 2.72

3. Have vapors been identified in any confined spaces (basement, sewers)? YES NO

4. Estimated depth to groundwater: 4 feet

Estimated groundwater flow direction: radial

5. Estimated distance and direction from point of release to nearest:

a. Private well: > 1/2 Mile

b. Municipal well: > 1/2 Mile

c. Surface water/wetland: Detroit River, > 1Mile South

6. Since last report: a. cubic yards of soil remediated: 1,520

b. gallons of groundwater remediated: 0

7. Totals to date: a. cubic yards of soil remediated: 6,260

b. gallons of groundwater remediated: 2,800

8. Michigan RBCA Site Classification (1-4): 1

9. Has contamination migrated off-site above Tier 1 Residential RBSLs YES NO

If YES, have off-site impacted parties been notified (per Section 21309a(3) of Part 213 YES NO

10. MTBE

Has MTBE been detected in any groundwater sample?

YES NO

Maximum MTBE concentration found in groundwater

39 ppb.

CERTIFICATION OF REPORT COMPLETION

I, the undersigned CP, hereby attest to the best of my knowledge and belief that the statements in this document and all attachments are true, accurate, and complete. I certify that the report was submitted to the Remediation & Redevelopment Division (RRD).

FREE PRODUCT RECOVERY STATUS REPORT

Authorized by Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Act 451).

INSTRUCTIONS: Use the checklist below to ensure that all required information is provided in the Quarterly Free Product Recovery Status Report and submit WITH THE SUPPLEMENTAL REPORT COVER SHEET (EQP3849) to the appropriate Remediation & Redevelopment Division (RRD) district office. See form eqp4410 for a complete list of RRD district offices. Include this checklist as a table of contents. Each page of the report should be consecutively numbered. The location column should be completed with the appropriate page number for each item. Refer to Storage Tank Division Operational Memorandum No. 7 for further instructions. The reporting schedule may be altered at the discretion of the DEQ project manager based on site conditions.	FACILITY ID NUMBER: 00013464
	SITE NAME: Detroit Department of Transportation
	COUNTY: Wayne

Section	Table of Contents	Page
1.0	<u>ACTIVITIES COMPLETED</u> Section 21307(2) and (3)(b),(c)	
	A. Describe response activities completed to address free product.	1
2.0	<u>EXPOSURE PATHWAY EVALUATION</u> Section 21307(2)(a),(e) and (3)(c)	
	A. Identify and describe complete exposure pathways related to the free product.	2
	B. Provide a scaled site map, which shows the extent of free product including the utility corridors, buildings with or without basements, private wells, and sensitive habitat/surface water.	1, Figure 1
3.0	<u>DATA TREND ANALYSIS</u> Section 21307(2)(c)(i),(ii) and (3)(c)	
	A. Provide a data summary table for all wells that contain free product. The table should include monitoring point location, date sampled, depth to water, free product thickness, and quantity of free product removed.	2, Table 1
	B. Provide graphs of static water elevations of a well near the free product plume versus free product apparent thickness compared over time. These graphs should be provided for all monitoring wells that have shown free product.	2, Graph 1
	C. Provide graphs of static water elevations versus groundwater concentration (e.g., Benzene, MTBE, and/or total BTEX) in select downgradient monitoring wells compared over time.	Graph 2
4.0	<u>FEASIBILITY ANALYSIS ON SELECTION OF RECOVERY SYSTEM</u> Section 21307(2)(c)(i),(ii) and (3)(c), and 21308a(1)(b)(xviii)	
	A. Provide initial and any subsequent bail-down test recovery data, analysis of which will determine the frequency of recovery. Refer to the references in Storage Tank Division Operational Memorandum No. 7 for sample calculations.	2
	B. Attach a schematic drawing of the free product recovery system.	2
5.0	<u>PERMITTING AND WASTE DISPOSAL TRACKING</u>	
	A. Provide copies of manifests or trip logs of liquid industrial waste or recycling per Section 21307(2)(c)(iii) and (3)(c), and 21308a(1)(b)(xvii)(H).	2
	B. Provide the air quality sampling results and calculations to meet Rule 290 of the Air Pollution Control Rules promulgated under Part 55, Air Pollution Control, of Act 451.	2
6.0	<u>OPERATION AND MAINTENANCE RECOVERY DATA</u> Section 21307(2)(c)(i),(ii) and (3)(c)	
	A. Describe any free product system design modifications, since last submittal.	2
	B. Provide the action levels that may trigger a change in remediation strategy.	2
7.0	<u>PROPOSED FUTURE ACTIONS</u> Section 21307(2)(e) and Section 21309a(2)(e)	
	A. Provide a schedule for free product evaluation and groundwater sampling.	3
	B. Provide a schedule outlining the next operation and maintenance activities.	3
	C. Provide the date of the next report.	3

**QUARTERLY FREE PRODUCT REPORT
DETROIT DEPARTMENT OF TRANSPORTATION
COOLIDGE FACILITY NO. 00013464
14044 SCHAEFER HWY, DETROIT, MICHIGAN**

FREE PRODUCT DISCOVERY, IMMEDIATE RESPONSE, AND REPORTING

Free Product Discovery

During a groundwater sampling event conducted on April 16, 2003, free product was discovered in monitor well MW-15 (refer to the attached Site Sketch for location) at the site.

Immediate Response Activities

Approximately 1.08 inches of free product thickness was measured and 0.05 gallons of free product were removed from MW-15 (refer to Table 1 for free product elevation data and removal quantities). The free product was removed from MW-15 by hand bailing using a disposable bailer and containerized in a 55-gallon steel DOT approved drum that was properly labeled and stored on-site. Existing monitor wells on- and off-site were gauged during the sampling event and free product was not present in any other monitor wells. In addition, the site was surveyed for possible fire, explosion, and vapor hazards. The results of the survey indicated that no fire, explosion, or vapor hazards were present.

Reporting

The Michigan Department of Environmental Quality (MDEQ) was notified within 24-hours by fax transmittal using the MDEQ Free Product Fax Transmittal form.

Following the May 15, 2003, site visit, monthly site visits have been continued to date. A monthly site visit was conducted on October 9, 2003 to gauge apparent free product thickness and perform free product recovery.

FREE PRODUCT REMOVAL ACTIVITIES

After the discovery of free product in MW-15, the site was monitored for free product on a weekly basis for one month. Since the quantity of free product removed was consistent, the frequency of the free product site monitoring visits was revised to monthly.

Field data obtained from the first monthly (June 26, 2003) free product site monitoring visit indicated a slight increase in free product thickness but not a significant increase. Since then the free product thickness has significantly decreased. Based on this information, the frequency of free product monitoring site visits will continue monthly and free product recovery will be performed by hand-bailing techniques.

The next monthly free product site monitoring visit is scheduled for November 2003. During the site visit, the existing nearby monitor wells on- and off-site will be screened. If it is determined that the quantity or thickness of free product has significantly increased or free product is discovered in other monitor wells, the current free product recovery

method will be revised to an active recovery system. No free product has been observed in any other wells on- or off-site

EXPOSURE PATHWAY EVALUATION

Exposure pathways applicable to the site are consistent with the Final Assessment Report (FAR).

FREE PRODUCT DELINEATION

Free product will be delineated during the installation of the proposed remediation system (as summarized in the Corrective Action Plan of the Amended FAR dated August 28, 2003).

DATA TREND ANALYSIS

Free product elevation data, apparent free product thickness, and quantity of free product removed from April 16, 2003 through October 9, 2003 is presented in Table 1. Graph 1 depicts the static water level elevations of MW-15 versus the apparent free product thickness over time. The results of a free product bail-down test performed at MW-15 can be found in the first quarterly free product report. Graph 2 depicts the apparent free product thickness vs. the groundwater elevations in the existing wells on- and off-site.

FEASABILITY ANALYSIS ON SELECTION OF RECOVERY SYSTEM

On April 17, 2003, a bail-down test was performed at MW-15. The bail-down test recovery data for MW-15 is provided in the first quarterly free product report dated July 14, 2003. Based on the free product thickness and quantity encountered since October 9, 2003, monthly free product monitoring and recovery by hand-bailing method is appropriate. However, if the results of the free product delineation activities or monthly free product site monitoring indicate an unstable or increasing free product plume, then the current recovery system will be immediately revised to stabilize and reduce the plume.

PERMITTING AND WASTE DISPOSAL TRACKING

Free product recovered from MW-15 to date (a total of 2.72 gallons) was placed in a properly labeled, DOT approved, 55-gallon drum, and stored on-site.

Air quality sampling and calculations are not deemed necessary at this time since the free product is recovered by hand-bailing using a disposable bailer.

PROPOSED FUTURE ACTIONS

Monthly Free Product Monitoring

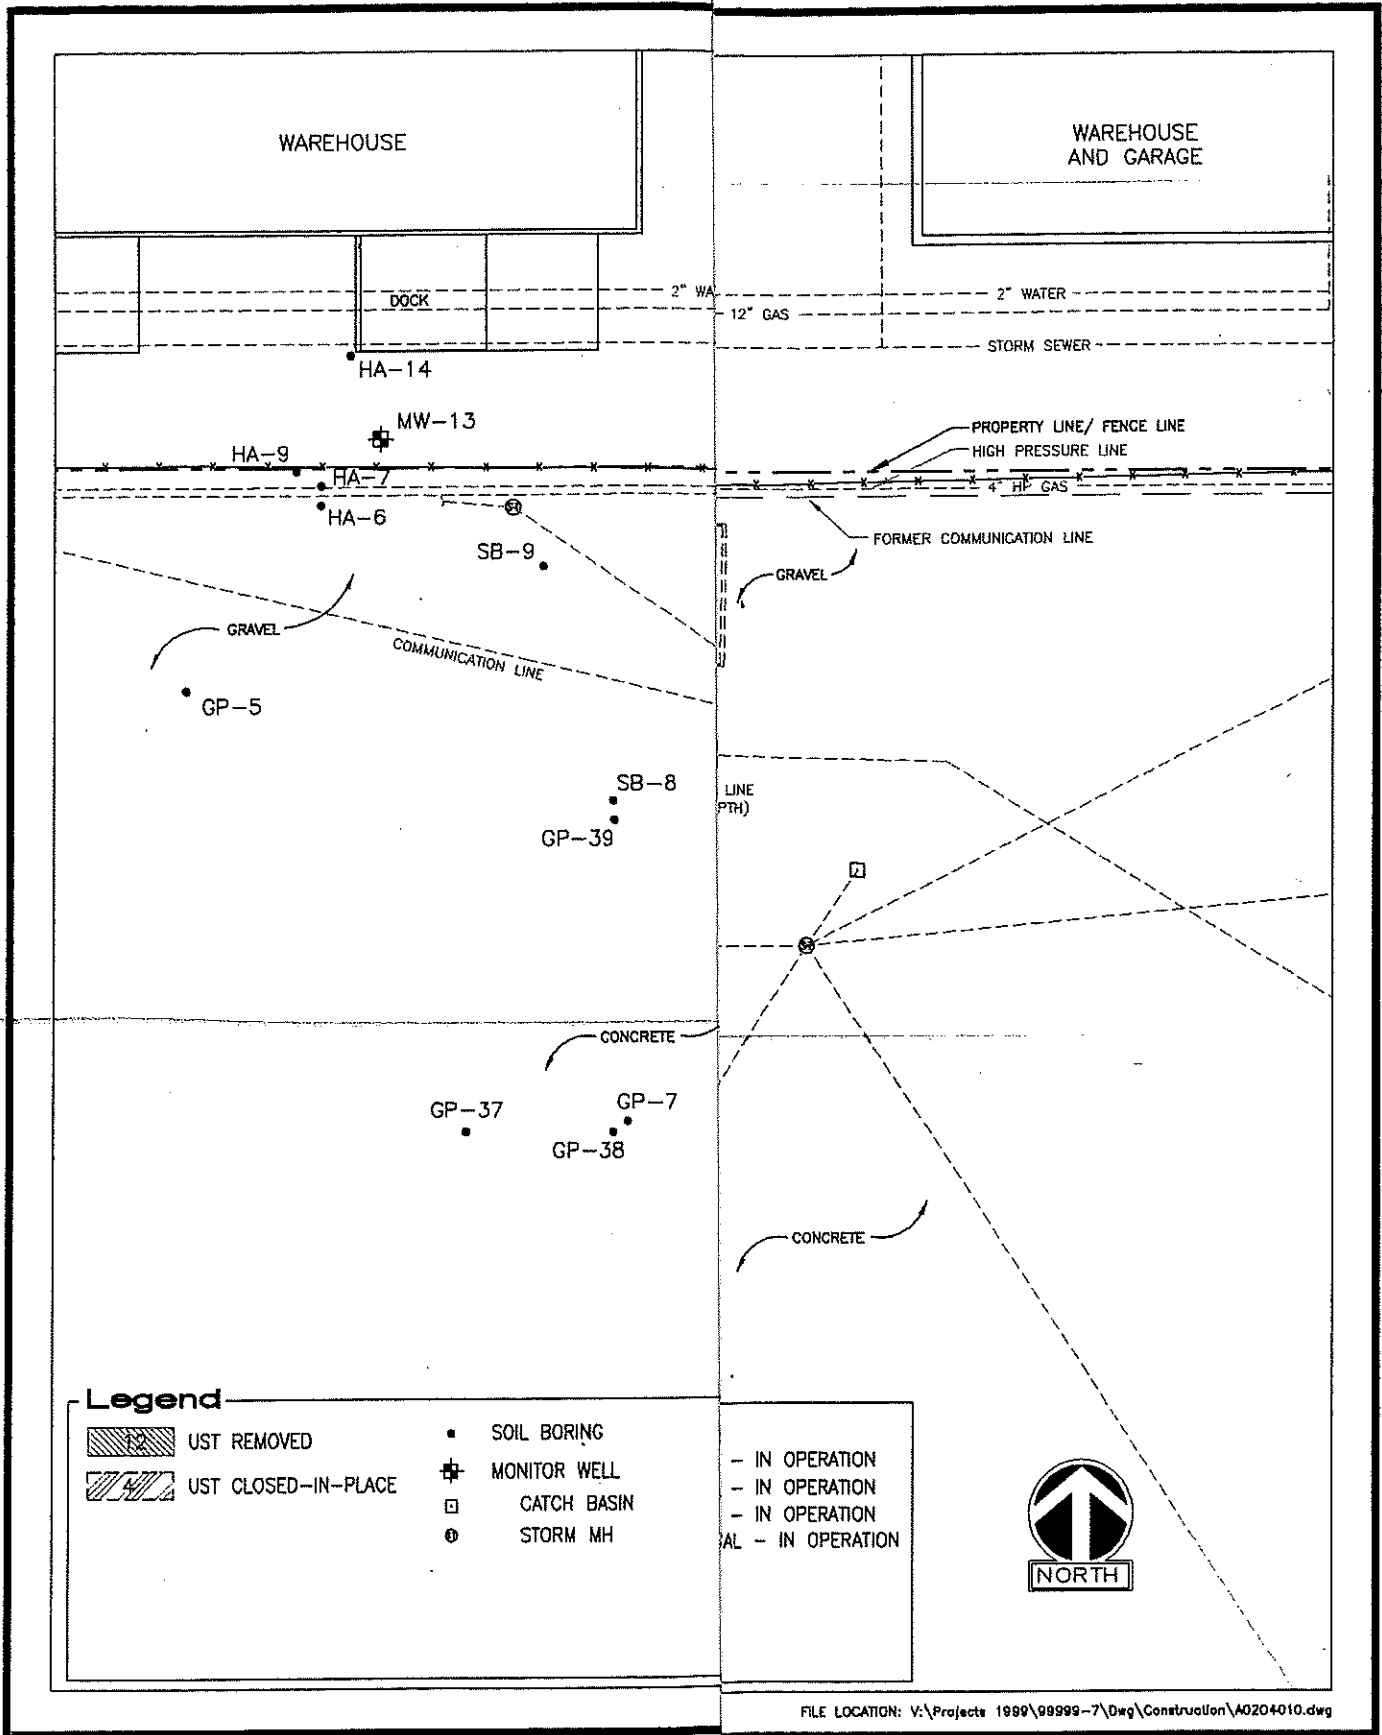

Monthly free product monitoring and recovery will continue.

Free Product Delineation Activities

The free product plume will be delineated during the installation of the remediation system. Due to system installation delays, the results will be included in the fourth Quarterly Free Product Report.

Next Quarterly Free Product Report

The next Quarterly Free Product Report will be submitted to the MDEQ on or before January 15, 2004.

Department of Transportation
City of Detroit
1301 East Warren
Detroit, Michigan 48207

Attention: Ms. Lovevett Williams

Dear Ms. Williams:

SUBJECT: Refined Petroleum Fund Notice Letter for City of Detroit Department of Transportation, 14044 Schaefer, Detroit, Wayne County
Facility ID No. 13464

This letter is to notify you that the Department of Environmental Quality (DEQ), Remediation Division (RD), plans to undertake response activities using State of Michigan (state) funds at the City of Detroit Department of Transportation (DDOT), located at 14044 Schaefer, Detroit, Wayne County (Property). Based on information in the Southeast Michigan District Office files, there have been releases of hazardous substances at this Property. Four releases were confirmed during the removal of numerous underground storage tanks (USTs) due to the presence of free product, stained soils, odors, and elevated field screening levels. A fifth release was confirmed due to a leaking transfer pipe which resulted in a significant release of hazardous substances and an evacuation of the building. The confirmed release dates are December 20, 1999 (2 releases), December 30, 1999, January 25, 2000 and September 26, 2006. The nature and extent of the contamination has not been determined. The response activities to be undertaken by the DEQ will take approximately six months, and include the characterization of source areas and defining the extent of soil and groundwater contamination.

Our files indicate that the DDOT is currently the owner and operator of the underground storage tank system, and is a liable party because it was the owner and operator at the time of the releases. The district office file for the DDOT facility indicates the following:

- Free product, discovered at the site both at the time of the releases and subsequently, has not been adequately addressed.
- Although the DDOT conducted some initial response activities at the facility, the DEQ has not received any information regarding response activities at the facility since 2003. The extent of contamination has not been defined, and the grossly contaminated soils at the facility have not been addressed.
- There has been no information submitted in response to the September 26, 2006, release.

Pursuant to Rule 115 of the Part 201 Administrative Rules, R 299.5115, the DEQ is providing you an opportunity to undertake the work described above. If you intend to undertake this work, please contact me within 14 days of receipt of this letter with your written commitment that includes a schedule to conduct this work, or a submittal of any information that demonstrates that this work was conducted in compliance with Part 213 of the NREPA. If the DEQ does not receive an affirmative commitment or documentation to support the work was conducted, the RD intends to utilize authorized state funds to conduct response activities at the Property. Please be aware that any state funds expended that are related to a release of hazardous substances at this Property are potentially subject to cost recovery by the state. Failure to undertake the work may result in other enforcement actions. Although, further enforcement actions are not our intent at this time, Rule 115 requires us to notify you of this possibility.

Pursuant to the authority of Section 20117(3) of the NREPA, you will be requested to grant voluntary access to the Property for the DEQ, its employees, contractors, or authorized representatives if the DEQ performs these response activities.

The files used in preparing this notice are located at the DEQ's Southeast Michigan District Office. If you wish to review these files, or if you have questions regarding this letter, please direct your inquiries to: Mr. Pewu Bah-Deh, Southeast Michigan District Office, RD, DEQ, 27700 Donald Court, Warren, Michigan 48092. Mr. Bah-Deh's telephone number is 586-753-3828; or you may contact me at the telephone number below.

Sincerely,

Paul Owens, District Supervisor

CERTIFIED MAIL

Dear Owner/Operator:

SUBJECT:

Facility ID No. 0-013464, Confirmed Release No. C-1388-99
DEPARTMENT OF TRANSPORTATION, 14044 SCHAEFER HWY, DETROIT, MI

On 12-30-99, the Department of Environmental Quality (DEQ), Storage Tank Division (STD), was notified of a release of a regulated substance from an underground storage tank (UST) system at the above location. Attached is a copy of the confirmed release report. As the owner or operator of this facility with a reported release, you are responsible for hiring a qualified underground storage tank consultant to conduct all appropriate corrective actions at this location, including submission of reports by the deadlines set forth in Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. If you do not agree that you are responsible for conducting corrective actions at this facility, you may submit supporting documentation to the STD DETROIT OFFICE within 30 days from receipt of this letter that demonstrates that you were not responsible for the release. Attached is informational memo IM-8, revised January 8, 1997, which provides general information on liability.

Please refer to Part 213 and the attached flow chart to help guide you through the requirements. STD approval is needed for any institutional controls that are a part of the cleanup program. The STD may audit or oversee all aspects of corrective actions undertaken pursuant to Part 213. You are required to contact our district office at least 48 hours prior to conducting on-site activities, using the attached form.

The STD requires the use of forms to assist in the reporting requirements. The required forms are available from the district office. A LUST report cover sheet should be submitted with each report. In addition, you are required to notify the STD of any changes to your UST system using a registration form.

Be advised that pursuant to Section 21313a and 21323 of Part 213, the owner or operator may be subject to penalties for not preparing and submitting the reports outlined in Part 213. In addition Section 21324 of Part 213 provides that a person who submits or causes to be submitted false or misleading information may be found guilty of fraud.

Please include the Facility ID No. found under "Subject" at the top of this notification with each submittal and on any future correspondence. Should you have questions regarding this letter, or need additional information, please contact the STD DETROIT OFFICE at (313) 392-6480.

Sincerely,

Terri Harmon

Dear Mr. Savage:

~~SUBJECT: Gannett Fleming Contract of August 5, 2008, (RD #8010)~~

The Michigan Department of Environmental Quality is prepared to begin development of a work plan and project assignment for remedial investigation at City of Detroit - DOT - 14044 Schaefer, Site ID #82002470, in Wayne County. The project manager for this site will be Pewu Bah-deh of the Southeast Michigan District Office in the Remediation Division. Please contact Mr. Bah-deh at 586-753-3828 to initiate work plan development.

The State Project Manger is responsible for assuring site work is done in accordance with the above contract, verifying and attesting to the accuracy of invoices, and verifying that invoices are within the terms of the contract.

If you have any questions, please contact me at 517-373-2811.

Dear Mr. Ken Ong:

Subject: The Traverse Group, Inc., Former Qualified Underground Storage Tank
Consultant for Department of Transportation; 14044 Schaefer Highway, Detroit,
Wayne County; Facility ID No. 13464

The Department of Environmental Quality (DEQ), Remediation and Redevelopment Division (RRD) has been informed that The Traverse Group, Inc., the Qualified Underground Storage Tank Consultant (QC) retained to address the contamination from your leaking underground storage tanks at the above referenced site, has voluntarily discontinued its QC status.

Pursuant to Part 213¹, you are required to obtain the services of an approved QC to complete the corrective action activities. The approved QCs can be found at the following site:
http://www.deq.state.mi.us/sid-web/QC_Search.aspx.

If you have technical questions regarding your site, please contact the RRD district project manager, Mr. Pewu Bah-Deh, at (586) 753-3828 or by email at bahdehp@michigan.gov. If you have questions regarding the QCs, you may contact me at the telephone number listed below or by email at harmont@michigan.gov.

CERTIFIED MAIL

Detroit Dept of Transportation
1301 E Warren Ave
Detroit, MI 48207

Dear Accounting Division :

SUBJECT: Facility ID No. 00013464, Confirmed Release No. C-0288-06
Department Of Transportation
14044 Schaefer Hwy, Detroit, MI 48227-3659, Wayne County

On October 2, 2006, the Department of Environmental Quality (DEQ), Waste and Hazardous Materials Division (WHMD), was notified of a release of a regulated substance from an underground storage tank (UST) system at the subject location. Enclosed is a copy of the confirmed release report.

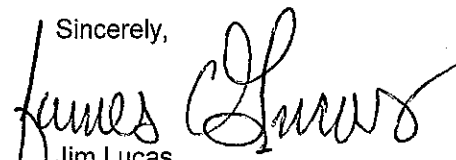

Pursuant to Part 213, Leaking Underground Storage Tanks, of the natural Resources and Environmental Protection Act, 1994 PA 451, as amended, you are responsible for hiring a Qualified Underground Storage Tank Consultant to conduct the required corrective actions at this location. Please see the enclosed information regarding the hiring of a QC. If you do not agree that you are responsible for conducting corrective actions at this facility, you may submit supporting documentation to the Remediation and Redevelopment Division (RRD) of the DEQ within 30 days from receipt of this letter that demonstrates you are not responsible for the release.

The RRD may audit or oversee all aspects of corrective actions undertaken pursuant to Part 213. Please be advised that the owner or operator may be subject to penalties for not submitting the reports outlined in Part 213. In addition, Section 21324 of Part 213 provides that a person who submits, or causes to be submitted, false or misleading information may be prosecuted for fraud.

Please note that you are required to notify the WHMD of any changes to your UST system using the form EQP3821 Registration of Underground Storage Tanks.

Please include the facility identification number in any further communications with the DEQ. Correspondence, including reports required under Part 213, should be submitted to the RRD Detroit Field Office, 3058 West Grand Blvd., Suite 2-300, Detroit, MI 48202-6058. Should you have questions regarding this letter, or need additional information, please contact the Detroit Field Office at (313) 456-4700.

Sincerely,

Jim Lucas

COMMENTS (attach additional sheets if necessary): A leaking fuel clamp in the transitional sump in fuel bay has been identified as the source of diesel fuel release. It is not yet known which of the four 25,000-gallon diesel USTs currently use at the site leaked. 1,536 gallon of diesel fuel has been recovered to date.

STORAGE TANK DIVISION
TOWN CENTER
PO BOX 30157
LANSING MI 48909-7657

August 1, 2000

Ms. Carolyn L. Paplin
The Traverse Group
3772 Plaza Drive
Ann Arbor, MI 48108

Dear Ms. Paplin:

SUBJECT: Variance to the Storage and Handling of Flammable and Combustible Liquids Rules, Rule 305, Section 2-4.2.1(b), for the Gilbert Facility, 5600 Wabash, Detroit, Wayne County, Facility No. 9182575 and for the Coolidge Facility, 14044 Schaefer Highway, Detroit, Wayne County, Facility No. 9182190

This is in response to the above-subject variance request dated June 2, 2000, on behalf of the Detroit Department of Transportation (DDOT) Gilbert and Coolidge facilities, to install four 25,000 gallon and four 30,000 gallon aboveground storage tanks (ASTs) that will contain Class II liquid for private motor vehicle fueling.

Rule 305, Section 2-4.2.1(b) of the Storage and Handling of Flammable and Combustible Liquids (FL/CL) Rules, 1992 AACRS R 29.4101 et seq., states that each tank, containing Class II liquid for private motor vehicle fueling, shall be limited to a maximum of 15,000 gallons individual capacity and not more than 30,000 gallon aggregate capacity. The 15,000 gallon individual capacity and the 30,000 gallon aggregate capacity has been determined to offer an AST system the same degree of fire safety as that of an underground storage tank (UST) system and to limit a spill from these ASTs to a set maximum.

Your variance request is to install four 25,000 gallon and four 30,000 gallon ASTs that will contain Class II liquids for private motor vehicle fueling. The reason for this request is due to the fact that the USTs that were used to fuel the fleet of DDOT vehicles have been removed and now there are no other tanks in working order available to fuel the DDOT fleet.

In order for a variance request to be granted, there must be satisfactory explanation of why compliance is not possible or what fire and environmental equivalencies will be provided. Adequate reasons were not provided to show why compliance cannot be met.

Further, the proposed system upgrades for additional fire, safety, and environmental protection listed in the variance request are all requirements of the FL/CL Rules, 1992 AACS R 29.4101 et seq., and are not considered additional equivalencies for fire and environmental protection.

Based on the above information, granting the requested variance would result in an increased hazard to life, property or the environment. Therefore, your variance request is denied as stated.

However, this office would be open to meeting with you and representatives of your client, at your convenience, to discuss possible equivalencies, contingencies, and alternatives to what you have proposed that would potentially allow you to operate these two facilities. If such a meeting is desired, please contact this office at the number below.

If you wish to appeal the denial of this variance request, please complete and forward the enclosed Petition for Contested Case Hearings within 60 days of receipt of the denial.

If you have any additional questions concerning this matter, please contact Ms. Andrea Zajac, Chief, Technical Review Unit, at 517-335-7294.

Sincerely,

Roger Przybysz, Chief
Storage Tank Division

CERTIFIED MAIL

Dear Owner/Operator:

SUBJECT:

Facility ID No. 0-013464, Confirmed Release No. C-88-00
DEPARTMENT OF TRANSPORTATION, 14044 SCHAEFER HWY, DETROIT, MI

On 01-26-00, the Department of Environmental Quality (DEQ), Storage Tank Division (STD), was notified of a release of a regulated substance from an underground storage tank (UST) system at the above location. Attached is a copy of the confirmed release report. As the owner or operator of this facility with a reported release, you are responsible for hiring a qualified underground storage tank consultant to conduct all appropriate corrective actions at this location, including submission of reports by the deadlines set forth in Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. If you do not agree that you are responsible for conducting corrective actions at this facility, you may submit supporting documentation to the STD DETROIT OFFICE within 30 days from receipt of this letter that demonstrates that you were not responsible for the release. Attached is informational memo IM-8, revised January 8, 1997, which provides general information on liability.

Please refer to Part 213 and the attached flow chart to help guide you through the requirements. STD approval is needed for any institutional controls that are a part of the cleanup program. The STD may audit or oversee all aspects of corrective actions undertaken pursuant to Part 213. You are required to contact our district office at least 48 hours prior to conducting on-site activities, using the attached form.

The STD requires the use of forms to assist in the reporting requirements. The required forms are available from the district office. A LUST report cover sheet should be submitted with each report. In addition, you are required to notify the STD of any changes to your UST system using a registration form.

Be advised that pursuant to Section 21313a and 21323 of Part 213, the owner or operator may be subject to penalties for not preparing and submitting the reports outlined in Part 213. In addition Section 21324 of Part 213 provides that a person who submits or causes to be submitted false or misleading information may be found guilty of fraud.

Please include the Facility ID No. found under "Subject" at the top of this notification with each submittal and on any future correspondence. Should you have questions regarding this letter, or need additional information, please contact the STD DETROIT OFFICE at (313) 392-6480.

Sincerely,

Terri Harmon

LANSING MI 48909-7657

August 1, 2000

Ms. Carolyn L. Paplin
The Traverse Group
3772 Plaza Drive
Ann Arbor, MI 48108

Dear Ms. Paplin:

SUBJECT: Variance to the Storage and Handling of Flammable and Combustible Liquids Rules, Rule 305, Section 2-4.2.1(b), for the Gilbert Facility, 5600 Wabash, Detroit, Wayne County, Facility No. 9182575 and for the Coolidge Facility, 14044 Schaefer Highway, Detroit, Wayne County, Facility No. 9182190

This is in response to the above-subject variance request dated June 2, 2000, on behalf of the Detroit Department of Transportation (DDOT) Gilbert and Coolidge facilities, to install four 25,000 gallon and four 30,000 gallon aboveground storage tanks (ASTs) that will contain Class II liquid for private motor vehicle fueling.

Rule 305, Section 2-4.2.1(b) of the Storage and Handling of Flammable and Combustible Liquids (FL/CL) Rules, 1992 AACS R 29.4101 et seq., states that each tank, containing Class II liquid for private motor vehicle fueling, shall be limited to a maximum of 15,000 gallons individual capacity and not more than 30,000 gallon aggregate capacity. The 15,000 gallon individual capacity and the 30,000 gallon aggregate capacity has been determined to offer an AST system the same degree of fire safety as that of an underground storage tank (UST) system and to limit a spill from these ASTs to a set maximum.

Your variance request is to install four 25,000 gallon and four 30,000 gallon ASTs that will contain Class II liquids for private motor vehicle fueling. The reason for this request is due to the fact that the USTs that were used to fuel the fleet of DDOT vehicles have been removed and now there are no other tanks in working order available to fuel the DDOT fleet.

In order for a variance request to be granted, there must be satisfactory explanation of why compliance is not possible or what fire and environmental equivalencies will be provided. Adequate reasons were not provided to show why compliance cannot be met.

Ms. Carolyn L. Paplin

2

August 1, 2000

Further, the proposed system upgrades for additional fire, safety, and environmental protection listed in the variance request are all requirements of the FL/CL Rules, 1992 AACRS R 29.4101 et seq., and are not considered additional equivalencies for fire and environmental protection.

Based on the above information, granting the requested variance would result in an increased hazard to life, property or the environment. Therefore, your variance request is denied as stated.

However, this office would be open to meeting with you and representatives of your client, at your convenience, to discuss possible equivalencies, contingencies, and alternatives to what you have proposed that would potentially allow you to operate these two facilities. If such a meeting is desired, please contact this office at the number below.

If you wish to appeal the denial of this variance request, please complete and forward the enclosed Petition for Contested Case Hearings within 60 days of receipt of the denial.

If you have any additional questions concerning this matter, please contact Ms. Andrea Zajac, Chief, Technical Review Unit, at 517-335-7294.

Sincerely,

Roger Przybysz, Chief
Storage Tank Division
517-373-2789

Detroit, MI 48227-3659
County - Wayne
Facility ID - 00013464

ATTENTION: Ken Ong

An Inspection Against a Complaint was conducted on September 26, 2006, at the above-subject facility for compliance with Part 211, Underground Storage Tank Regulations, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Act 451), the Michigan Underground Storage Tank Rules (MUSTR), 1999 AACS R 29.2101 et seq. and the applicable sections of the rules for the Storage and Handling of Flammable and Combustible Liquids, 2003 AACS R 29.5101 et seq. The inspection showed that the facility is disapproved.

- 1 Piping joints shall be liquid tight and shall be welded, flanged, threaded, grooved, friction type or chemically bonded.
UST 280.10 (J) (FL/CL Part 2, Section 3.2.2)

Special Attention : A leak was found and repaired at the 4" clamshell type APT flex pipe fitting inside the piping transition sump located in the garage area.

- 2 Interstitial or monthly monitoring shall be conducted in accordance with 280.44 (C).
Section 280.44(C)

Special Attention : The DEQ Underground Storage Tank Plan Review Report dated 3/7/01 states that "Sump sensors shall be installed in accordance with the following: the piping shall be sloped sufficiently toward the sensor; the sensor shall be mounted where it will detect both product and water; the sump housing the sensor shall be liquid-tight; the sensor shall detect both fuel and water; the sensor shall activate an audible or visual alarm, and shall SHUT OFF THE PUMP when activated unless a mechanical or electronic line leak detector is installed in the piping." At this time it is unclear whether or not the existing console went into alarm mode as a result of the sensor being submerged in diesel fuel, but there is no indication that the existing pumps ever shut down as a result. There currently are no mechanical or electronic line leak detectors installed on the diesel or gasoline systems.

- 3 An approved release detection method shall be initiated and properly maintained for tanks and piping.
UST 280.40

Special Attention : The sump sensor for the piping transition sump was improperly elevated inside the sump, however, the sensor was submerged in the diesel fuel. The existing EBW Tank Monitoring console was in alarm mode, without paper, and appears to not be working properly. A Warrick Controls panel located on the north wall of the garage near the piping transition sump was in alarm mode but the Inspector was informed that this control panel was for the oil/water separator located just outside the building. ALL release detection equipment will need to be tested for proper function. Control panels will be required to be properly I.D., sensors identified, and instructions posted with the contact person (name & number) to be contacted in case of alarm conditions.

- 4 Inventory control shall detect a release of at least 1% of flow through of product plus 130 gallons per month. To use this method a person shall 1) daily measure inputs, withdrawals and product remaining, then record and compute each operating day, 2) equipment shall measure product to 1/8 of an inch 3) product level is measured before and after each delivery, 4) drop tube shall be within 1 foot of the bottom of tank, 5) product being dispensed is metered and 6) water is measured in tank once a month to 1/8 of an inch. UST 280.43(A)

Special Attention : Start performing inventory control per the EPA pamphlet "Doing Inventory Control Right for Underground Storage Tanks" provided to you by the Inspector.

- 5 Owners and operators shall report a release within 24 hours of the discovery of the release.
Section 280.61

Special Attention : The Inspector informed Mr. Ong during the 9/27/06 site meeting that a confirmed release needed to be submitted for this incident. Inspector provide Mr. Ong with a Free Product Fax Transmittal form EQP3800. Inspector received a phone call from Mr. Ong indicating that the form has been submitted to Lansing.

Inspector received a PEAS notice regarding a leaking gasoline underground storage tank that required the terminal building to be evacuated on 9/21/06. Inspector was shown by DDOT maintenance personnel a building sump that had been pumped out and suspected of being the source of the fumes. The odor of petroleum was present upon entering the basement of the terminal building and free product appeared to be in the building sump.

A piping transition sump located inside the garage building next to the portion of the utilities tunnel which runs from the garage to the terminal building was found to be full and overflowing with diesel fuel. The underground drainage system for this tunnel is believed to flow into the sump located in the terminal building.

The Inspector ordered the diesel fuel system shut down, the piping sump, tank sump, oil/water separate, building sump, and any test wells in the immediate area pumped out and properly disposed of. Provide documentation, including manifests of that disposal.

The Inspector conducted an existing inspection of the facility as a result of this incident and will identify other violations at the facility that needs to be corrected in a report to follow.

The material and equipment failure, lack of monitoring of the release detection equipment, and improper installation or maintenance of the existing fuel system contributed to an unknown, possibly substantial amount of free product being release. The basement in the terminal building should be well vented and the existing building sump needs to be monitored daily (especially after rain) for the accumulation of free product and flumes.

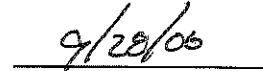

The inspection and violations (if any) were discussed with Ray Chenault at the time of the inspection.

Documentation shall be furnished to the district office identified below verifying that the violation(s), cited in this inspection report have been corrected. The documentation shall be provided by October 28, 2006. If the cited violation(s) are not corrected and/or certification of compliance is not provided by the date specified, a reinspection will be conducted. The owner or operator of this facility will be subject to civil and criminal provisions pursuant to Part 211 of Act 451, including and not limited to placement of tags to the tank(s) prohibiting delivery of product if the stated violations have not been corrected.

If you have additional questions concerning this matter, please contact me.

Site Address: 14044 Schaefer Avenue, Detroit
Site County: Wayne **DEQ District:** Southeast Michigan
Managing District, Section or Division for Project: Southeast Michigan
Project Manager Name: Pewu Bah-Deh
Phone Number: 586-753-3828

PROJECT DESCRIPTION

This site has operated as a transportation facility for the city of Detroit for numerous years. The site operated as many as 24 underground storage tanks which contained dextron, converter/oil, engine oil, used oil, gasoline, diesel, and water. Four confirmed releases of diesel, gasoline, and engine oil were reported. Currently, six tanks remain in use; the others have been removed or closed in place. During removal of the tanks, 2,540 cubic yards of contaminated soil and 2,800 gallons of contaminated groundwater were removed. Also 272 gallons of free petroleum product were recovered. A limited investigation indicated the contamination has migrated off site; however, due to financial restraints, the city has not conducted remedial actions to address the remaining contamination. This project includes conducting an investigation to determine the extent of contamination and actions needed to protect public health and the environment.

AMOUNT AUTHORIZED: \$150,000

APPROPRIATION: Refined Petroleum Fund

SITE SUMMARY

Site Name	City of Detroit - DOT - 14044 Schaefer	County	Wayne
Street Address	14044 Schaefer Avenue	DEQ District	Southeast MI
City	Detroit	Legislative Districts	
Site ID#	82002470	MI Senate	003
SID Facility ID	00013464	MI House	011
		US Congress	015

LOCATION

This site is located on the Northwest side of Detroit on Schaefer, just north of Schoolcraft Street. There is a salvage yard west of the site, across Schaefer. The rest of the surrounding is mostly small commercial businesses.

SITE HISTORY (Response Activities Undertaken to Date)

This site has operated as a city of Detroit Department of Transportation facility for unknown number of years. It is historically owned and managed by the city of Detroit, Department of Public Works. The site is zoned commercial and is surrounding by small commercial business establishments.

The underground storage tanks (USTs) at the site were installed between 1946 through February 2001. Of the total 24 USTs installed, 18 were either removed or closed-in-place from December 1999 to January 2000. Contents of the removed USTs included dextron, converter/oil, engine oil, used oil, gasoline, diesel, and water. The remaining six USTs are used to store diesel, gasoline, and used oil. The capacities of the 24 USTs ranged from 500 gallons to 50,000 gallons.

A total of four confirmed releases have been reported for the site, at the site (3 in 1999 and 1 in 2000). The released products consisted of diesel, gasoline, and engine oil. In 2000 a diesel transfer pipe failed and resulted in a significant release of product near the building which caused the evacuation of the building. In addition to these releases, free product was discovered in MW-15 in April 2003.

Prior to the 2000 release, 2,540 cubic yards of impacted soil and 2,800 gallons of contaminated groundwater were excavated and disposed of during USTs removal. A total of 272 gallons of free product was also recovered. The limited investigation conducted at the site indicate that 24 temporary wells and nine permanent monitor wells were installed. Soil data from some of the 24 soil borings installed, indicate that the contamination has migrated off-site, therefore, a Notice of Off-Site Migration was filed with the DEQ.

Reports submitted to the DEQ to date include an Initial Assessment Report, a Final Assessment Report, and two Free Product Status Reports. The site is currently considered out of compliance with Part 213, Leaking Underground Storage Tanks, of the Natural Resources and Environmental Response Act, Act 451 of 1994, as amended. The city of Detroit has not conducted any response actions since 2003. The city has been determined to be a non-viable liable party.

SITE STATUS (Risks Requiring Action)

Extensive free product is present at the site and the extent is not defined. Overall, the extent of soil contamination has not been defined. Additional remedial actions are needed to determine the risks posed by the free product and heavily impacted soils to off-site properties. Assessment of the vapor intrusion pathway is needed.

STATE FUNDS ALLOCATED FOR CLEANUP ACTIVITIES*: \$150,000.00

UNMET NEED			
FY	Activity	Amount Needed	Comments
2013	IR	\$250,000	mitigate free product and grossly contaminated soils

*State funds are set aside to complete activities at this site but may not be expended.

APPENDIX J

Photo 1: Looking northeast from near Schaefer Hwy. at the Subject Property Main Building which is located at 14044 Schaefer Highway in Detroit, Michigan. The Coolidge Bus Terminal formerly occupied this portion of the Subject Property.

Photo 2: Looking northwest at the rear side of the former Coolidge Bus Terminal building, which was originally constructed in 1928 as a streetcar maintenance facility and was converted to bus maintenance and storage in 1947.

Photo 3: Looking north at the former Fare Box Building (left) and Heating Plant Building (at right adjacent to stack). Guy wires for the onsite antenna tower are also visible.

Photo 4: Looking northwest at the former Terminal Building, which is located in the northwest portion of the Subject Property. This building is connected to the Main Building through an underground tunnel.

Photo 5: Looking north at a former residential dwelling located in the southwestern portion of the Subject Property along Compass Street. This dwelling is now abandoned and in severe disrepair, and was not physically entered.

Photo 6: Looking northwest at an occupied residential dwelling located at 13500 Compass Street in the southern portion of the Subject Property. Vacant land adjoins this portion of the Subject Property to the west, south, and east.

Photo 7: Looking north at vacant land at 13366-13374 Compass Street in the southern portion of the Subject Property. The east adjoining properties contain more vacant land as well as an occupied dwelling at 13350 Compass Street.

Photo 8: Looking southwest at an abandoned dwelling located at 14023 Ward Avenue in the eastern portion of the Subject Property. Vacant land and illegal dumping of household refuse were observed throughout this area.

Photo 9: Looking southwest at a vacant dwelling located at 14045 Ward Avenue in the eastern portion of the Subject Property. The west end of Kendall Street where it meets the bus terminal property is seen at right.

Photo 10: Looking northwest at a vacant residential dwelling located at 14101 Ward Avenue in the eastern portion of the Subject Property, just north of Kendall Street.

Photo 11: Looking west at discarded items in a vacant parcel in the eastern portion of the Subject Property. Illegal dumping was observed throughout this area of the Subject Property.

Photo 12: Looking west at an abandoned residential dwelling located at 14151 Ward Avenue in the eastern portion of the Subject Property. Fire damage was evident within the structure and it appeared unsafe to enter.

Photo 13: Looking northwest at an overgrown lot located at 14167 Ward Avenue in the eastern portion of the Subject Property. No occupied dwellings were present at the Subject Property along Ward Ave.

Photo 14: Looking southwest at an overgrown and vacant formerly residential area along Ward Avenue in the northeast portion of the Subject Property. The dwelling seen at left is located at 14173 Ward Avenue and was marked condemned as dangerous and unsafe.

Photo 15: Looking north at a gasoline dispenser near the 12,000-gallon gasoline underground storage tank (UST) located north of the Main Building. A 10,000 to 12,000-gallon gasoline UST is located in this area. Historical records are conflicting whether this tank is actually 10,000 or 12,000-gallon capacity.

Photo 16: Looking west at the access covers above the diesel underground storage tanks (USTs). Four 25,000-gallon diesel USTs installed in 2001 are located in this area.

Photo 17: Looking northeast at the automatic tank gauge which serves the nearby underground storage tanks. Clean Fuel Solutions personnel were present onsite during the site reconnaissance and indicated the diesel USTs are constructed of steel with no cathodic protection system.

Photo 18: Looking northeast within the gas house portion of the Main Building. Oil staining was present on the concrete flooring in this area. The concrete floor was cracked and deteriorated.

Photo 19: Looking south (and downward) beneath one of the five removed diesel fuel dispensers. Apparent dyed diesel fuel was observed in the dispenser sump at this location.

Photo 20: Looking northeast at an oil stain in the southwest portion of the gas house. The oil had migrated into a nearby crack in the concrete as well as trenches in the area.

Photo 21: Looking west at the southern portion of the gas house which contained the gasoline fueling area. A hydraulic lift was also present within this area (at grade in left bay).

Photo 22: Looking southeast at a gasoline dispenser in the southern portion of the gas house.

Photo 23: Looking southwest (and downward) beneath the gasoline dispenser in the southern portion of the gas house. Unknown fluids were present within the dispenser sump at this location.

Photo 24: Looking east at open trenches in the maintenance area of the Main Building. Grating which formerly covered the trenches had been removed in several areas.

Photo 25: Looking northeast at sand from an unknown location which was present on the concrete floor throughout the eastern portion of the maintenance area of the Main Building.

Photo 26: Looking southeast at 55-gallon drums of transmission fluid and unknown contents in the eastern portion of the maintenance area of the Main Building.

Photo 27: Looking southeast at 55-gallon drums of apparent transmission fluid and unknown contents in the eastern portion of the maintenance area of the Main Building.

Photo 28: Looking northeast at a hydraulic fluid reservoir (far left) and deteriorated 55-gallon steel drum located between the maintenance area and gas house in the northern portion of the Main Building. The roof was deteriorated in this area which allowed water to infiltrate.

Photo 29: Looking northeast at the pump room in the western portion of the maintenance area within the Main Building. Various lubricants and waste remained within 30 and 55-gallon steel drums in this area.

Photo 30: Looking northeast at a trench within the maintenance area of the Main Building, which was formerly used to access the underside of buses during maintenance such as oil changes. Oily water was observed within this and several other trenches in the vicinity.

Photo 31: Looking east at the fire damaged portion of the former coach storage area within the Main Building.

Photo 32: Looking southeast at engine oil aboveground storage tanks located in the gas house portion of the main Building. De minimus staining of the surrounding concrete floor was observed in this area.

Photo 33: Looking southwest at a 1,500-gallon antifreeze aboveground storage tank and several empty 250-gallon and 275-gallon totes stored north of the gas house portion of the Main Building.

Photo 34: Looking southwest at an in-ground oil water separator to the east of the bus wash portion of the gas house, which is located in the northern portion of the Main Building.

Photo 35: Looking northwest at an in-ground oil water separator located east of the maintenance area portion of the Main Building. The metal cover was welded in-place which prohibited further assessment.

Photo 36: Looking northeast at the former bus storage area in the eastern portion of the Site, to the east of the Main Building, Fare Box Building, and Heating Plant Building.

Photo 37: Looking east at the southern portion of the Subject Property, to the south of the Main Building coach storage area. A residential area along Compass Street is located to the right beyond the concrete wall.

Photo 38: Looking northwest at the concrete paved area west of the Main Building at the Subject Property. The former Dispatch Building is seen at left in the background, and the Terminal Building is seen to its right. Both are located along Schaefer Hwy.

Photo 39: Looking southwest at the location of a waste oil underground storage tank to the west of the maintenance area of the Main Building.

Photo 40: Looking southwest at the northern portion of the Gas House portion of the Main Building. Gasoline odors were noted in the storm sewer catch basin in the bottom central portion of the photo, beneath the scrap steel.

Photo 41: Looking southwest at Danny's Auto Parts which adjoins the Subject Property to the west and southwest.

Photo 42: Looking northwest at the O.H. Frisbie Moving and Storage Company which adjoins the Subject Property to the northwest.

Photo 43: Looking northeast at the O.H. Frisbie Moving and Storage Company which adjoins the Subject Property to the north.

Photo 44: Looking northwest at a former electrical shop located at 13200 Intervale Street which adjoins the Subject Property to the northeast.

Photo 45: Looking southeast at vacant land along Ward Ave. which adjoins the Subject Property to the east.

Photo 46: Looking southeast at primarily vacant dwellings and overgrown parcels along Ward Ave. to the southeast of the Subject Property.

Photo 47: Looking north at vacant parcels along Compass Street which adjoin the Subject Property to the southeast.

Photo 48: Looking northeast at occupied and abandoned residential dwellings along Compass Street which adjoin the Subject Property to the southeast.

Photo 49: Looking southwest at vacant land and the unused portion of Littlefield Street which adjoins the Subject Property to the south.

Photo 50: Looking northwest at vacant land owned by the El Beth Church located north of Compass Street and east of Schaefer Hwy which adjoins the Subject Property to the southwest.

APPENDIX K

SCOTT G. PARK, C.P.G.

ENVIRONMENTAL DEPARTMENT MANAGER

Mr. Park is a Senior Geologist responsible for project supervision and management, client contact, evaluation and assessment of contaminated sites, coordination of field efforts, preparation of reports, and oversight of staff. His areas of specialty include former Manufacture Gas Plants (MGPs), underground storage tank (UST) regulations – Michigan’s Part 213 of Public Act 451; site investigations and closures – Part 201 of Michigan’s Public Act 451; Phase I/II environmental site assessments and baseline environmental assessments – Part 201 of Michigan’s Public Act 451; groundwater contamination and remediation; soil contamination and remediation; RCRA facility investigation.

EDUCATION

MS, Geology, Western Michigan University, 1987
 BA, Geology, Albion College, 1984
 ASFE Fundamentals of Professional Practice #16
 Magna cum Laude

REGISTRATIONS

Certified Professional Geologist, AIPG #10371

AFFILIATIONS

American Institute of Professional Geologists (AIPG)
 Western Michigan University Faculty
 Lansing Community College Faculty
 Lansing/Dewitt Sunrise Rotary Past President

SPECIAL TRAINING

PSMJ Project Manager Training, 2015
 40 Hour OSHA 29 CFR HAZWOPER Trained
 8 Hour OSHA Annual Refresher Health and Safety Training

**Work with Previous Employer*

Mr. Park has been the principal investigator and project manager for industrial and underground storage tank projects, and bedrock, soil and groundwater site investigations, including multiple aquifer evaluations throughout Michigan and has prepared RIFS, Remedial Action Plans, No Further Action reports, and underground storage tank site assessment documentation including initial and final assessment reports and closure reports in accordance with Part 213 of Act 451. Mr. Park’s experience also includes on-site geologist/coordinator for numerous groundwater and soil sampling events and monitoring well installations.

Mr. Park has provided project management and supervisory experience for more than 500 Transaction Due Diligence assessments in Michigan and Ohio, including extensive multiple city block assessments in urban and commercial districts in Michigan. He managed field exploration and report preparation relating to the completion of Category N, D, & S Baseline Environmental Assessments (BEAs) in accordance with Part 201 of Act 451, including both submittals for disclosure purposes or with application for adequacy determination.

PROJECT EXPERIENCE

PHASE I ESA/TRANSACTION DUE DILIGENCE

- **Standard Federal Bank/Lasalle Bank/Bank of America** – Project Manager and staff geologist for over 200 Phase I ESAs on behalf of various financial institutions in Michigan. Projects covered vacant greenspace, to large industrial and commercial businesses, and included purchases, refinances and bank foreclosures. *

- **Demmer Corporation** – Project Manager for over 20 Phase I ESAs and multiple BEAs for Demmer Corporation redevelopment in Michigan, Minnesota and South Dakota. *
- **7-Eleven, Various Locations in Michigan** – Staff Geologist for completion of 15 BEA and Due Care Plans on behalf of 7-Eleven for the purchase and redevelopment of 15 retail gas stations in Michigan. *
- **Michigan Department of Transportation** – Staff Geologist for completion of Phase I ESA, BEA and Due Care plan for the purchase of a large 100 acre former industrial facility, and historic 1812 battle field in Monroe, Michigan. *

MANUFACTURED GAS PLANTS (MGP)

- **Manufactured Gas Plant (MPG)** – Prior to joining DLZ in July 2015, Mr. Park was a Senior Geologist and Project Manager with AECOM. His experience at AECOM includes being the Project Manager of Five Michigan MGP sites for **Consumers Energy** that included Remedial Investigation (RI) reporting, exposure pathway analyses, source remediation, deed restrictions and No Further Action (NFA) reports. *

MUNICIPAL BROWNFIELD

- **RCRA Brownfield Site, Lansing, Michigan.** Project Manager and Principal Investigator for industrial redevelopment of one of Michigan's first brownfield sites. The project entailed initial due diligence investigations including Phase I, Phase II studies, Category S baseline environmental assessments, and subsequent RCRA facility investigation and proposed RCRA corrective measures. Project involved exposure pathway evaluations and fate and transport of volatile organics in groundwater and potential risks to third parties and municipal water supply systems. *
- **Arcadia Creek Corridor - Phase II Environmental Assessment, Kalamazoo, Michigan.** Project Manager and Principal Investigator of an extensive Phase II assessment for business redevelopment of nine square blocks. This project included identification and definition of six groundwater contaminant plumes and multiple areas of soil contamination through the installation of 58 monitor wells and the drilling of numerous soil borings. *
- **Arcadia Creek Corridor –Soil Remediation, Kalamazoo, Michigan.** Project Manager for soil remediation on three city blocks for downtown Brownfield Redevelopment. *
- **Township of Owosso, Brownfield Site, Owosso, Michigan.** Project Manager and Principal Investigator of a 60-acre abandoned industrial brownfield property. Project included preparation of a brownfield revitalization loan on behalf of the township, soil and groundwater investigation, geophysical investigation, free product identification and evaluation, and completion of a Category S baseline environmental assessment on behalf of proposed new property owners. The BEA, involving use of designed engineered controls was approved for adequacy by the MDEQ. *

LEAKING UNDERGROUND STORAGE TANK SITE

- **Waterford Township Parks & Recreation LUST Closure.** Project geologist involved in contaminant and geological review and interpretation of a Leaking Underground Storage Tank closure. Closure included LIF/UVOST data used to delineate residual contamination on private property and MDOT Right-of Way.

Closure included the preparation of an MDOT Technical Summary Report and approved MDOT Licensing Agreement.

- **Michigan Department of Environmental Quality (MDEQ), Superstop #9, Lansing Michigan.** Project Manager for a Part 213 LUST investigation of a highly contaminated active gasoline station in Lansing. DLZ was retained to evaluate exposure risks including vapor intrusion as a result of both residual and mobile LNAPL under the station and adjacent to residential homes. The investigation completed in 2016 included the delineation of LNAPL and its migration, and the installation and sampling of 12 vapor points for vapor intrusion assessment.
- **Michigan Department of Environmental Quality (MDEQ), Former Frank’s Service, Durand Michigan.** Project Manager for a Part 213 LUST investigation of a former gasoline station, now converted into a restaurant. After completion of an interim response excavation, DLZ was retained to monitor groundwater impacts and evaluate ways to enhance natural attenuation of contaminants. A sulfate based chemical “Nutrisulfate” was selected to increase the anaerobic bioattenuation. DLZ oversaw the injection of 1,000 gallons into the impacted zone of groundwater. Initial results show good distribution of the product and increased contaminant attenuation.
- **Michigan Department of Environmental Quality (MDEQ), Herricks Service & Grocery, Owosso Michigan.** Project Manager for a Part 213 LUST investigation of a former gasoline service station converted into a residential home. The project included a Remedial Investigation designed to assess exposure risks to residential occupants including vapor intrusion and drinking water. Results confirmed the historical attenuation of contaminants and no evidence of exposure risks to occupants.
- **Michigan Department of Environmental Quality (MDEQ), Gregory Market, Gregory Michigan.** Project Manager for a large scale Part 213 LUST investigation of both bedrock and glacial aquifers in a multi-block area of Gregory Michigan. The project has included a Remedial Investigation, Feasibility Study, Remedial Design, System Installation Oversight and Operation and Maintenance. Ongoing groundwater treatment of the glacial aquifer includes the use of nutrient enhanced low flow biosparging to aid in the bio-attenuation of gasoline related groundwater impacts adjacent to and beneath commercial buildings while reducing effects of volatilization. *
- **MDEQ, Lakeland Montessori School, Lakeland Michigan.** Project Manager for this Part 213 LUST project involving both source remediation and groundwater treatment with InSitu Chemical Oxidation (ISCO). Source Remediation involved engineering design, and oversight of dewatering, excavation and disposal of highly contaminated source soils with support design of an adjacent state highway and the Montessori School building. Subsequent groundwater treatment has included the use of ISCO injection to enhance the oxidation and biological attenuation of gasoline related contaminants and installation and the installation of a granular activated carbon (GAC) barrier to reduce concentrations of VOCs venting into adjacent surface water. *
- **MDEQ, D&L Fuels, Charlotte Michigan.** Project Manager for this Remedial Investigation involving the evaluation of comingled plumes from both USTs and an AST bulk fuel facility. Upon demonstrating the comingling and source locations, the RI included Laser Induced Fluorescence (LIF) technology to evaluate the vertical and horizontal extent of NAPL originating from the multiple source locations. Vertical Aquifer

Profiling was then completed to evaluate the extent of the dissolved plumes. Source Remediation involved engineering design, and oversight of dewatering, excavation and disposal of highly contaminated source soils with support design of an onsite commercial building. At DLZ Scott has continued to manage the source area RI and interim response including LNAPL delineation and the use of multi-phase extraction (MPR) to abate remaining free phase LNAPL.

- **MDEQ, Clark #2128, Brighton, Michigan.** Project Manager for this Part 213 LUST project involving the investigation of NAPL gasoline identified by the current owner during a BEA investigation, and the unrestricted use of private water wells on nearby properties. The objective of the investigation was to evaluate if impacted groundwater, and/or free phase product are posing an immediate threat and acute hazard to receptors in the area. The project included the definition of both vertical and lateral plume boundaries. Confirmed attenuation of groundwater plume prior to reaching any receptors. Confirmed that on-site and adjacent private drinking water wells were not impacted by release at site. Achieved confirmation of no completed exposure pathways. *
- **MDEQ, Oasis Truck Stop, Hartland, Michigan.** Project Manager for this Part 213 LUST project involving the investigation of gasoline and heavy oils released from the former truck stop and repair garage. The investigation has included contaminant migration along two water bearing units and site geology ranging from glacial outwash sands to peat deposits. Results indicate that adjacent private water wells have not been impacted and that no completed exposure pathways exist. *

LANDFILL INVESTIGATION/HYDROGEOLOGY

- **Waste Management Peoples Landfill, Birch Run Michigan** - Principal Investigator for a large scale landfill hydrogeology investigation involving potential leachate migration from a former Act 87 waste cell into adjacent surface water. The investigation included a detailed analysis of stratigraphy, groundwater migration, and seasonal geochemical analyses of both surface water and groundwater. The results prompted the proposal and subsequent construction of a impermeable landfill cap and slurry wall around the former Act 87 cell. Due to the project complexity of the results and corrective action, a presentation was made to the MDEQ WHMD Quality Review Team (QRT), and the subsequent Final Assessment Report (FAR) was approved by the MDEQ. *
- **Waste Management Tri-City Landfill, Carsonville, Michigan** – Project Manager for a hydrogeological investigation completed for cell expansion permitting. The investigation and reporting included evaluating aquifer characteristics beneath and surrounding the landfill, in-depth evaluation of site geology including distribution of confining strata, and local groundwater chemistry. *
- **Consumers Energy BC Cobb Ash Landfill, Muskegon Michigan** – Principal Geologist for the site evaluation including potential offsite surface water discharges of metals originating from coal ash placement. The project resulted in the preparation of a Remedial Action Plan, approved by the MDEQ, and the subsequent installation of a slurry wall around the ash landfill to eliminate offsite groundwater migration. The successful abatement efforts resulted in the property being redeveloped into municipal recreational facilities.

BEDROCK INVESTIGATION

- **Michigan Department of Environmental Quality – Gregory Market, Gregory Michigan** - Project Manager for a bedrock investigation, involving the potential migration of hydrocarbons into the shallow drinking water bedrock aquifer. The investigation involved coring and logging the upper 75 feet of the Pennsylvanian age Marshall Sandstone, vertical aquifer sampling using inflatable packers, and installation of six bedrock monitor wells. The investigation trace concentrations of chemicals in the bedrock aquifer, unrelated to the local petroleum impacts.
- **Thermos Factory – Norwich Connecticut** - Field manager and principal site geologist for the investigation of migrating DNAPL (TCE) in fractured bedrock in Connecticut. The six month investigation included bedrock coring and logging, vertical aquifer sampling using inflatable packers, and monitor well installation in bedrock horizons showing highest dissolved DNAPL concentrations.*

WATER RESOURCES

- **MURCO Foods, Plainwell Michigan** - Principal geologist and project manager of long term monitoring of groundwater impacts resulting from land application of waste generated at the beef processing facility. Many years of land application of process waste waters resulted in groundwater impacted with elevated nitrate, phosphorous and ammonia. After converting to a waste water treatment facility in 2000, processes of phytoremediation and natural attenuation have resulted in a contaminant reduction of at least 80% in the potable aquifer and have greatly reduced exposure risk to impacted groundwater. Groundwater monitoring continues through monitoring well and residential well sampling.

LITIGATION AND EXPERT WITNESS

- **Fred's Tire & Auto, Fowlerville, Michigan.** Project Manager for evaluation of potentially responsible party and source locations regarding commingling of groundwater contaminant plumes at adjacent sites. The evaluation included forensic analysis of gasoline free product (NAPL) for relative age dating of releases. Litigation support was provided for issues relating to identification of responsible party for investigation and remediation of groundwater contaminated with gasoline free product (NAPL). *

PUBLIC FORUMS AND PRESENTATIONS

- **Municipal Well Field Vulnerability Assessments.** Coordinator and certified instructor of municipal well field vulnerability assessments, as governed through the Department of Homeland Security. Instruction through Inter Tribal Council at municipalities in Michigan, Wisconsin and Minnesota. *
- **Michigan Department of Environmental Quality, Birch Run Michigan.** Presented corrective measures proposal relating to leachate containment for a solid waste landfill. Presentation led to DEQ approval of the remedial action plan (RAP). *

EDUCATION

B.S. Civil and Environmental Engineering, Michigan State University

SPECIAL TRAINING

MDOT Field Book / Field Manager Training – 2006

MDOT Materials Process and Acceptance Seminar – 2010

MDEQ Certified Storm Water Operator – 2002

Radiation Safety Officer / Instructor 2010

Radiation Safety Training Program for Density Gauges on August 2002

PSMJ A/E/C Project Management Bootcamp – 2008

OSHA 40-hour HAZWOPER training and All Current 8-Hour Refreshers

Must Safety Program

OSHA Confined Space Entry Training – 2003

** Work with Previous Employer*

DOR'MARIO L. BROWN

CONSTRUCTION DIVISION MANAGER

Mr. Brown is a highly talented professional and dedicated Civil Engineer with more than 19 years of experience in consulting engineering. He has supervised construction monitoring, materials testing, and quality control for construction projects throughout Michigan. Mr. Brown has managed multi-discipline, multi-million-dollar construction projects. Typical construction operations included foundation installations (caissons, friction piles, auger cast piles, mat foundations, micropiles, and shallow footings), fill placement (and other earthwork), concrete operations, grout / masonry applications, and asphalt paving for roadways and parking lots. Projects included multi-story office buildings, manufacturing facilities, hotels, shopping centers, large warehouses, department stores, communications towers, utility installations, and roadway certifications.

Most Notable Project: Mr. Brown worked extensively on the Detroit Multi site Demolition project which consisted of property surveys, asbestos and lead sampling, hazardous material surveys, and demolition oversight of over 23 industrial / commercial building throughout the city of Detroit. Mr. Brown was featured in a news article in the Detroit Free Press during the demolition of the former Detroit Lead Smelter Plant on E. Nevada. Mr. Brown was responsible for the field oversight and project management of the demolition of this facility.

Mr. Brown has also managed and performed environmental site feasibility studies related to the assessment of underground storage tanks (UST), environmental clean-ups and hydrogeologic investigations, tank removals and site closures. Evaluated options and feasibility in developing remedial investigations, work plans, and their implementation. Performed field reconnaissance, observed installation of groundwater monitoring wells, and interpreted hydrogeologic data. Coordinated environmental sampling of soil, groundwater, and interpretation of analytical data relating to petroleum hydrocarbons, volatile organic compounds, heavy metals and other chemical substances. His work also involves extensive client contact, including contract management, program development, and assisting clients in negotiations with federal, state and local regulatory agencies. Mr. Brown specializes in ESA and PCA surveys, subsurface investigations, and remediation system installation.

PROJECT EXPERIENCE

- **City of Ann Arbor Waste Water Treatment Plant, Ann Arbor, Michigan.*** Project Manager. Construction observation and material testing for the Waste Water Treatment Plant. Included daily oversight of quality control reporting on measurements and computations, scheduling and oversight of material testing, and complete project documentation. (2017)

- **MDOT-Miller Road, M-14 to Maple Sidewalk, Ann Arbor, Michigan.*** Project Manager. Construction inspection services for the reconstruction of Miller Road. Work included construction and materials testing: Concrete, aggregates, density, HMA on concrete road reconstruction (2017)
- **Springwells Water Treatment Plant, Detroit, Michigan.*** Project Manager. Construction inspection services for the Water Treatment Plant to include interior below ground structures. Project involved soil borings, concrete testing, site survey, GPRS, masonry observation and engineering consulting for the Water Treatment Plant. Included daily oversight of quality control reporting on measurements and computations, scheduling and oversight of material testing, and complete project documentation.
- **Evergreen Road, 9 Mile to Northwestern Highway, Southfield, Michigan.*** Project Manager. Construction inspection services for the reconstruction of Evergreen Road. Quality Control on concrete and beam break testing. (2017)
- **City of Dearborn As-Needed Engineering Services, Dearborn, Michigan.*** Project Manager. Provided as-needed construction observation and material testing for the City of Dearborn. Included soil borings, petrographic analysis, oversight of quality control reporting on measurements and computations, scheduling and oversight of material testing, and complete project documentation. (2018)
- **MDOT-Schaefer Road, Dearborn, Michigan.*** Project Manager. Construction inspection services for the reconstruction of Schaefer Road. Work included construction and materials testing: Concrete, aggregates, density, HMA on concrete road reconstruction. (2018)
- **Wayne State University, Multidisciplinary Biomedical Research Building, Detroit, Michigan.*** Project Manager. This project features nearly 200,000 square feet of space for about 500 researchers and staff and 68 principal investigators. It included wet and dry laboratories, and faculty offices Construction Oversight. (2015)
- **City of Detroit Public Safety Headquarters, Detroit, Michigan.*** Project Manager. This project included the construction of and completely renovating and converting the former MGM temporary casino facility into the City of Detroit's New Public Safety Headquarters. Retrofit new building with old buildings to check the concrete and re-steel for the final design and implementation for the rehabilitation of the building structure during construction. (2018)
- **MDOT-Beech Daily Road from Eureka to Brest, Taylor, Michigan.*** Project Manager. Construction and materials testing: Concrete, aggregates, density, HMA. (2016)
- **MDOT-Schaefer Road between Ford Road and Michigan Avenue, Dearborn, Michigan.*** Project Manager. Construction and materials testing: Concrete, aggregates, density, HMA. (2016)
- **City of Ann Arbor West Madison Street Improvement Project, Ann Arbor, Michigan.*** Project Manager. Construction and materials testing: Concrete, aggregates, density, HMA. (2018)
- **City of Novi, 2013 Neighborhood Roads Project, Various Locations, Novi, Michigan.*** Project Manager. Construction and materials testing: Concrete, aggregates, density, HMA. (2018)

- **Connor Creek CSO, Detroit, Michigan.*** Construction coordinator for inspection services for the combined sewer overflow structures to include interior and exterior below ground structures. Project involved soil borings, concrete testing, site survey, GPRS, masonry observation, re-steel, and other engineering consulting.
- **The Corradino Group, Detroit, Michigan. Detroit International River Crossing.*** Construction coordinator to collect relevant geotechnical data and evaluate conceptual designs for a cable-stayed bridge, suspension bridge, or tunnel. The program included computer modeling effort that determined the size and extent of cavity that may be subject to collapse through complex three-dimensional finite difference analysis. Included implementing the results of the geophysical modeling program. Program of cross-well seismic imaging was selected, supplemented by vertical seismic profiling, and down-hole geophysical logging. Assisted to develop the final submittal to the Federal authorities.
- **City of Dearborn CSO Contract 7 & 8 Dearborn, Michigan.*** Project Manager. For the construction installation for deep underground sewer structures. Completed installation with observation and material testing for the City of Dearborn combined sewer program. Included structure rehabilitation, petrographic analysis, oversight of quality control reporting on measurements and computations, scheduling, safety program and oversight of material testing, and complete project documentation.
- **Executive Drive Concrete Reconstruction, Macomb County, Michigan.*** Provided Construction observer role with complete engineering inspection, survey, and materials testing services for an economic development project on 1.03 miles of concrete road reconstructing with drainage improvements and new sidewalk. Mr. Brown provided Construction Engineering services including pre-construction services, progress and other required meetings, daily on-site construction observation including concrete pavement placement, storm sewer installation, water main and fire hydrant installation, material testing and assistance with construction survey services, daily quantity tracking and postings using Field Manager, and full project documentation.
- **City of Lansing CSO Program, Michigan.*** Construction coordinator for the installation of the storm sewer piping, storm sewer tap in, Soil Erosion Sedimentation Control reporting and the implementation of the newly adapted policy of Geo-fabric wrapping of the open joints in the Reinforced Concrete Pipe. Storm pipe sizes ranged from 12 inch to 42 inch. Also coordinated density testing on the compacted backfill, developed the punch list, and reviewed as-built drawings.
- **Selfridge Air National Guard Base, Mt. Clemens, Michigan.*** Project Manager for repair of Squadron Building and Logistics Command Post to include site utilities. Coordinated with contractor and owner, job progress meetings, punch list and punch list review.
- **Greek Town Casino, Detroit Michigan.*** Project Manager for the 31-story post tension concrete building construction.

DANIEL T. MCNEELY

ENVIRONMENTAL SCIENTIST

Mr. McNeely has over 14 years of professional experience in environmental, health, and safety compliance; construction, decommissioning, and demolition management; due diligence; environmental remediation; and infrastructure upgrade projects for federal, industrial, commercial, and municipal clients. He has extensive experience performing site assessments, environmental sampling, building characterization, remedial actions, indoor air quality assessments and industrial hygiene, cost estimating, waste management, and coordination of multiple tiers of subcontractors and contractor oversight.

PROJECT EXPERIENCE

- **Zephyr Remedial Action, Former Zephyr Refinery – Fire Suppression Ditch, Muskegon, Michigan; U.S. Environmental Protection Agency Great Lakes National Program Office.** Construction Oversight. Performed construction oversight during remediation of contaminated sediments within a wetland adjacent to the Muskegon River, as well as subsequent wetland habitat restoration activities. Remedial design included relatively dry excavation of contaminated sediments, in situ treatment of characteristically hazardous sediments (lead), dewatering, water treatment, and offsite disposal of contaminated sediments. Assisted with community outreach, including participation in public meetings and coordination with local stakeholders. (2017-2018) *
- **Environmental Remediation Services, Selfridge Building 1533 – Detroit Arsenal, Harrison Township, Michigan; U.S. Army Environmental Command.** Served as field lead during takeover of operations and monitoring of an existing air sparge/soil vapor extraction system, as well as field manager during remedial construction at this former Nike missile facility that is currently used by the U.S. Customs and Border Patrol for vehicle maintenance. Remedial construction activities completed at the site included soil excavation, excavation dewatering, installation of an air sparge system in combination with oxygen-releasing compound injections to treat groundwater impacts, and installation of a bioventing and sub-slab depressurization system. Ongoing support for this project includes operation and maintenance of the newly installed air sparge system. (2015-2017) *
- **Remedial Action-Operations, Long-Term Monitoring, and Project Closeout; Sites 3 and 25, 148th Fighter Wing, Duluth, Minnesota, Minnesota Air National Guard; Site 9, Alpena Combat Readiness Training Center, Alpena, Michigan, Michigan Air National Guard.** Field Manager. Field Manager for

groundwater data gap investigations, in situ and ex situ remediation, long-term monitoring and project closeout conducted at the 148th Fighter Wing Sites 3 and 25 in Duluth, Minnesota and at the Alpena Combat Readiness Training Center Site 9 in Alpena, Michigan. Activities include monitoring well installation, direct-push technology soil boring investigation, excavation, and disposal of petroleum-impacted soils, groundwater treatment via injections utilizing multiple substrates (EHC, EHC-L, and Nutrisulfate), and bioaugmentation utilizing a dehalococoides inoculum, and placement of oxygen-release compound Advanced® as an excavation backfill amendment. Activities are currently ongoing and scheduled to continue through September 2018. Responsible for successfully executing all field activities including ensuring coordination between subcontractors, clients, and regulators, and balancing budgetary and schedule concerns as well as ensuring the health and safety of all onsite personnel are protected during the project. (2017-2016) *

- **Emerging Contaminant Investigation at Multiple Air National Guard Installations throughout the United States; National Guard Bureau.** Field Manager. Field manager for the investigation of emerging contaminants (i.e., 1,4-dioxane and perfluorooctanoic acid/ perfluorooctanesulfonic acid) at 7 Sites across 5 Air National Guard Installations throughout the Midwestern United States. Investigation included monitoring well installation and sampling. Investigations were conducted under a global health and safety plan/accident prevention plan and site-specific work plans with site-specific summary reports prepared. (2015-2016) *
- **Vapor Intrusion Study, Zanesville Air National Guard Station, Zanesville, Ohio; Air National Guard Restoration Branch.** Served as team member during work plan implementation to assess whether subsurface soil gas and potential vapor intrusion into indoor spaces were a complete or incomplete pathway. Activities included installation of sub-slab sampling points using a hammer drill, leak testing the sampling points, indoor air, and sub-slab air sampling using summa canisters and flow regulators, real-time ambient air quality monitoring and pressure differential monitoring during sampling, and site restoration activities. (2015) *
- **East Petroleum, Oils, and Lubricants Yard Corrective Action; Selfridge Air National Guard Base, Harrison Township, Michigan.** Field Manager and Health and Safety Officer responsible for work plan preparation, overseeing soil excavation, backfill amendment application, monitoring well installation and groundwater monitoring activities to remediate a historical jet fuel release. Excavation activities included eight separate cavities, including five soil excavation areas and three groundwater remediation areas, installed to a maximum depth of 10 feet below ground surface. Approximately 2,430 tons of impacted soil was removed and disposed offsite. Approximately 58,000 gallons of impacted groundwater was treated and discharged onsite. PermeOx Plus®, an oxygen-releasing backfill amendment, was added to the three groundwater areas during backfill activities to address groundwater impacts. Subsequent to the excavation activities, performance groundwater monitoring was conducted to evaluate current site conditions. *
- **Areas 2/8A Corrective Action; Selfridge Air National Guard Base, Harrison Township, Michigan.** Field Manager and Health and Safety Officer responsible for implementation of pre-corrective action data-gap investigation to delineate the impacted area, work plan preparation, overseeing soil excavation, x-ray fluorescence screening of flooring and sidewalls, and monitoring well installation and groundwater monitoring activities (including “Clean Hands” sampling method for low-level mercury) to remediate metals-

impacted soils within a former canal along Lake St. Clair. Excavation activities included two separate cavities and were installed to a maximum depth of 10 feet below ground surface. Within the southern excavation, two water mains required protection during excavation, and several other abandoned utilities were also unearthed. Approximately 1,400 tons of impacted soil was removed and disposed offsite. Subsequent to the excavation activities, performance groundwater monitoring was conducted to evaluate remediation effectiveness. *

- **Environmental/Regulatory Manager; Detroit, Michigan; Chicago, Illinois; and Springfield, Massachusetts.** Responsible for management of hazardous waste at each of the three production facilities, including generation, storage, and disposal per Resource Conservation and Recovery Act and state/local requirements, as well as development and implementation of employee training programs including Lockout/Tagout, Hazard Communication, and Asbestos Awareness. Completed environmental health and safety facility compliance audits, provided plant engineers with health and safety guidance during infrastructure upgrades, and completed regulatory reporting as required by the Department of Homeland Security, Drug Enforcement Administration, Superfund Amendments and Reauthorization Act, and state and local regulations. *
- **Industrial Facility Closure/Decommissioning; St. Louis, Missouri.** Responsible for contractor oversight during regulatory closure of a former shallow well; removal and disposal of three underground storage tanks; repair of damaged friable asbestos and damaged lead-based paint; various mercury mitigation activities including bulk material removal and disposal, sewer line cleaning, and camera surveying to identify mercury impact and removal of building materials impacted by mercury; PCB-contaminated flooring cleaning and waste disposal; lead containing glass debris removal and disposal; ductwork cleaning, removal, and disposal; rooftop dust collector cleaning; and removal and disposal of bulk lead dust. Was also responsible for initiating daily Health and Safety meetings, photographic and written documentation of work performed, initiating change-order requests prior to out-of-scope work being performed, as well as daily client de-briefings. *
- **Industrial Facility Closure/Decommissioning; Fort Wayne, Indiana.** Responsible for contractor oversight during removal of mercury impacted building materials; cleaning an underground pit and equipment basin; removing residual chemicals and debris from several outbuildings; evacuation and cleaning of an oil/water separator; cleaning, debris removal, and concrete backfilling of a former enamel room basement; demolition and floor cleaning of a hazardous waste storage building; cleaning of an oil house interior as well as demolition of an adjacent concrete sump; PCB ballast and mercury lamp inventory and removal; wood-block flooring removal and cleaning of concrete sub-flooring; cleaning and painting of a former aboveground storage tank pad; and evacuation and cleaning of two back-up diesel generator fuel tanks as well as two 10,000-gallon water/oil mixture scavenger tanks. *
- **Residential Complex Demolition; University of Michigan, Ann Arbor, Michigan.** Performed a pre-demolition building materials characterization, contractor oversight, and air monitoring during asbestos abatement activities, as well as contractor oversight and air monitoring activities during demolition of a multi-story building on the University of Michigan campus. Was responsible for implementation of the project-specific Health and Safety Plan, real-time air monitoring to ensure no offsite dust migration, as well as client communications and final report preparation. *

- **Soil Excavation Management and Clearance Sampling; AMP Ohio, Hawesville, Kentucky.** Worked side-by-side with the prime contractor to remove and stockpile large quantities of contaminated soil discovered during construction of \$400M hydroelectric dam. Was responsible for overseeing all excavation activities and waste management, and to ensure client satisfaction with a constantly evolving scope of work. Worked alongside the prime contractor and multiple subcontractors to ensure both the consultant and its subcontractor's field activities were coordinated with busy haul roads and other high hazard site constraints including high tension power lines and extremely heavy machinery. *
- **Facility Closure, Underground Storage Tank Removal and Decommissioning; Troy, Michigan.** For lease termination assistance to client, provided oversight and documentation of monitoring well abandonment and ethylene glycol underground storage tank removal. Completed soil sampling on the sidewall and bottom of the tank after removal, and coordinated the evacuation and cleaning of four interior sumps. Conducted oversight, documentation, and mercury vapor monitoring before, during, and after removal of mercury-contaminated flooring and ceiling tiles as well as during other mercury abatement activities. *
- **Chromium Plating Facility Remediation; Baraga, Michigan.** This project entailed remediation of soil and groundwater impacted by hexavalent chromium from a former chromium plating facility in a remote area of northern Michigan. Was responsible for assisting with initial site and building characterization fieldwork, which included interior wipe sampling for PCBs; soil boring and sampling; groundwater monitoring well installation and sampling; and contractor oversight during soil excavation, transportation, and disposal. Site contaminants were found along a drainage ditch several thousand feet from the source, which flowed through a marshy wooded area, and had to be cleared, soil removed, and restored to native conditions. *
- **Soil and Lagoon Characterization Investigation, Underground Storage Tank Removal and Soil Excavation; Franklin, Indiana.** Completed soil and groundwater sampling for a Phase II environmental site assessment, as well as coordination and completion of subsequent quarterly groundwater characterization investigations. Groundwater collection encompassed sampling at an abandoned industrial facility, both indoors and outdoors, and from within a closed underground storage tank vault beneath the main manufacturing building. Performed contractor oversight during site preparation which included partial building demolition, as well as during removal of eight 12,000-gallon underground storage tanks and associated piping and impacted soil. Sidewalls were field screened and confirmatory samples were collected to verify excavation extents. During excavation, it was discovered that the vault was only partially constructed of cinderblock, and two of the vault walls were bare soil which required quick action to maintain a safe working environment. Also completed post-excavation monitoring well installation and sampling, as well as construction oversight during subsequent building renovations. *
- **Site Characterization Investigation; Plainwell, Michigan.** Along the banks and floodplains of the Kalamazoo River, conducted soil sampling using a slide hammer, core-puller, and 3-inch Lexan™ tubes. Soil cores were cut, capped, and taped to allow to be hiked to the next sample location through heavily vegetated areas. Sample sites included areas requiring stream crossings, steep hills, and slippery clay riverbanks. Over a period of 3 weeks, more than 300 sample cores were obtained by the field team from the most rugged terrain within the project area. Sampling was conducted while being overseen by the client, U.S. Environmental Protection Agency, and Michigan Department of Environmental Quality personnel. *

- **Soil and Groundwater Investigation for Perfluorinated Compounds; Former Grissom Air Force Base, Peru, Indiana.** Field Manager responsible for providing oversight of multiple internal staff as well as subcontractors, regulators, and client during soil and groundwater investigation for emerging contaminants (perfluorinated compounds) including perfluorooctanoic acid and perfluorooctanesulfonic acid. Project entailed daily perfluorinated compounds checklist as well as rigorous sampling protocols to ensure no cross-contamination of samples due to ubiquitous nature of contaminants. Field sampling protocol included special field clothing laundering procedures, as well as inability to use low density polyethylene, Teflon, Gore-tex, and/or other unapproved sunblocks, bug-sprays, or lotions during the project. *
- **Industrial PCB Investigation; Fort Wayne, Indiana.** Performed wipe sampling on several hundred pieces of machinery slated for disposal. Upon receipt of analytical results, it was determined that a pilot test to clean PCBs from the surfaces of various machines was necessary. Subsequently performed the pilot test PCB cleaning, confirmation wipe-sampling, as well as paint removal and sampling to evaluate if the PCBs had penetrated the painted surfaces of the machinery. *
- **Building Characterization; Providence, Rhode Island.** Performed building characterization of a large former industrial facility through bulk sampling of concrete floors, brick walls, and wood block floors. Wipe samples were also collected from various heating, ventilation, and air conditioning components and interior structural surfaces to determine feasible options for the decommissioning or demolition of the buildings. *
- **Building Characterization; Murfreesboro, Tennessee.** In preparation for facility demolition, assisted in the characterization of building components within this facility through wipe-sampling of ductwork, walls, columns, and concrete floors. Received refresher OSHA training regarding elevated work surfaces and fall protection due to sampling locations over 40 ft high and accessible only by aerial lifts. *
- **Environmental Health and Safety Facility Audit; Ann Arbor, Michigan.** Completed an environmental health and safety facility compliance audit of a specialty electronics manufacturer and Phase I Environmental Site Assessment to identify areas of non-compliance with local, state, and federal regulations, as well as make recommendations for improvements associated with best management practices.
- **Lockout-Tagout Program Development; Troy, Alabama and Houston, Texas.** Conducted assessments of onsite machinery at helicopter manufacturing facilities and developed an overall lockout-tagout program as well as created specific procedures for each piece of onsite machinery to be safely de-energized for maintenance activities. *
- **Industrial Hygiene Evaluation, East Aurora, New York.** Completed an evaluation of work stations throughout multiple buildings at an aircraft component manufacturing complex to determine whether engineering controls could be improved to lower employee exposures to select chemicals and metals. Air monitoring was then conducted to determine whether OSHA Permissible Exposure Limits had been exceeded. *
- **Indoor Air Quality Assessment, East Cleveland, Ohio.** This project required indoor air sampling of a former industrial facility which was being converted into a science, technology, engineering, and mathematics high school. volatile organic compound sampling was conducted using summa canisters as well as air sampling for mercury-vapor using adsorbent charcoal tubes. Indoor air was surveyed for mercury vapor using an

Ohio Lumex mercury vapor meter. Repeated the project's scope of work five times to prove the level of risk for the planned building use was acceptable. *

- **Indoor Air Quality Assessment, Romulus, Michigan.** A large distribution and warehousing facility was investigated to determine if PCBs or other heavy metals had been pulled through ventilation fans into the Site building after an adjacent environmental disposal company suffered major fire damage. Air and surface wipe samples were used to evaluate if building materials or products were impacted. *
- **Nuisance Dust Assessment, Farmington Hills, Michigan.** Responsible for completing a visual assessment and implementing a sampling approach to determine whether elevated levels of dust particulate were migrating offsite from a concrete products manufacturer offsite into a residential area. Aggressive air sampling was conducted at several locations around the perimeter of the property and analyzed for total particulate matter. *
- **Phase I Environmental Site Assessments at Locations throughout the United States.** Completed over 50 Phase I environmental site assessments for a wide variety of commercial and industrial clients at greenfields, brownfields, and both active and vacant facilities in excess of 850,000 square feet. Examples of the types of facilities include: *
 - Aerospace component manufacturing
 - Helicopter manufacturing
 - Plastic injection molding
 - Hot and cold wire drawing
 - Healthcare component manufacturing
 - Electrical component manufacturing
 - Electroplating
 - Former tire and rubber manufacturing
 - Dairy processing
 - Arms and ammunitions manufacturing
 - Mining equipment manufacturing
 - Logging equipment manufacturing
 - Various service-industry facilities.

EXECUTIVE SUMMARY

DLZ Michigan, Inc. was retained by the Detroit Building Authority (DBA) to conduct a Supplemental Phase II Environmental Site Assessment (ESA) of the property located at 14044 Schaefer Highway as well as 23 adjoining residential parcels along Compass Street and Ward Avenue in Detroit, Wayne County, Michigan; hereinafter referred to as the Subject Property. This Phase II ESA was performed at the request of the DBA to conduct additional assessment of areas throughout the Subject Property that are planned for construction of stormwater infrastructure.

The Subject Property is comprised of 24 parcels across approximately 23 acres including the unused former Coolidge Bus Terminal which sits on approximately 20 acres of land with eight vacant buildings and adjacent residential properties that may be made part of the overall project site in the future. The residential properties along Compass Street and Ward Avenue include to-be vacated alleyways, and vacated portions of Hartwell Avenue, Kendall Street, and Intervale Street, and are referred to as the Coolidge Bus Terminal Expansion Sites. The Subject Property Main Parcel is owned by the Detroit Department of Street Railways, a predecessor to the Detroit Department of Transportation (DDOT). The adjoining residential Expansion Sites parcels are owned by the Detroit Land Bank.

A Phase I ESA was conducted on the 20-acre main parcel of the Subject Property by DLZ in October 2019, and a Phase I ESA was later conducted by DLZ on the expanded approximately 23-acre Subject Property on August 27, 2021. In the August 2021 Phase I ESA, several Recognized Environmental Conditions (RECs) were identified and recommended for further investigation. The RECs identified during the August 2021 Phase I ESA included:

- The historical use of the Subject Property for bus maintenance and outdoor bus storage;
- The current and former presence of USTs, ASTs, vaults, and/or oil/water separators on the Subject Property, including approximately 800 gallons of standing diesel fuel discovered within the pump house “aqua system vault” during a December 1994 inspection by the Detroit Fire Department;
- Five confirmed releases reported at the Subject Property resulting in soil and groundwater contamination on the Subject Property and the presence of elevated concentrations of contaminants in the soil and groundwater at the Subject Property at levels that exceed EGLE Part 201 Residential Generic Cleanup Criteria and Screening Levels;
- The phenol-type odor and oily water in pits in the north-central portion of the Main Building;
- The historical industrial uses of the adjoining properties to the north and west; and,
- The former MGP site located approximately 300 feet north of the Subject Property.

Initial Phase II ESA field activities were performed at the 20-acre main parcel of the Subject Property between November 13 and November 26, 2019, to investigate the findings, including RECs, of the October 2019 Phase I ESA. During the initial Phase II ESA, 42 soil borings were advanced at the main

parcel of the Subject Property. Then, to further characterize subsurface soils and groundwater at the Subject Property, including the 23 adjoining residential parcels, DLZ performed Supplemental Phase II ESA field activities between January 26 and February 9, 2022. DLZ completed this Phase II ESA at the request of the DBA to conduct additional assessment of areas throughout the Subject Property that are planned for construction of stormwater infrastructure. Based on the data collected as part of this Phase II ESA, stormwater management infrastructure design may be influenced by existing soil and groundwater contamination at the Subject Property.

During the Supplemental Phase II ESA, a total of 39 soil borings were advanced at the Subject Property. Fourteen soil borings were advanced on the Coolidge Expansion Sites along Compass Street and Ward Avenue, and 25 soil borings were advanced on the main parcel of the Subject Property. Temporary groundwater monitoring wells were installed at twelve of the 81 soil boring locations, corresponding to locations where groundwater was encountered during drilling activities.

Specific findings of this Phase II ESA include the following:

- Shallow subsurface soils at the Site generally consist of sand with some gravel and debris/bricks/concrete (fill) from ground surface to approximately 4-5 feet bgs across the site. Below shallow subsurface soils, the Site generally consists of native medium stiff to stiff clay, silty clay or sandy clay to depths of 7-9 feet bgs, followed by a stiff to very stiff mottled clay to 12-14 feet bgs, and soft to stiff gray clay with high plasticity to a terminal depth of 15 feet bgs, with the exception of the central and northern sections of the Site where soils have been disturbed and backfilled with sand. Groundwater was encountered sporadically across the site at varying depths ranging from 4 to 11 feet bgs.
- Metals, VOCs, and/or SVOCs were detected in soil samples throughout the Site that exceeded the Groundwater Surface Water Interface Protection (GSIP) Criteria. Select locations as shown on the attached **Figure 5** through **Figure 7** also exceeded the Nonresidential Direct Contact (DC) Criteria. These contaminants could leach from existing soil and/or groundwater to stormwater within newly installed management infrastructure if not properly addressed during stormwater design, as well as create a worker exposure pathway during construction, respectively.
- SVOCs and VOC concentrations in soil exceeded the Nonresidential Soil Volatilization to Indoor Air Pathway (VIAP) Screening Levels at locations as shown on **Figure 6** and **Figure 7**, indicating potential indoor air inhalation pathways. At sample location SB-06, beneath the proposed location of the future Operations Building, SVOCs dibenzofuran and phenanthrene were detected in shallow soil at concentrations which exceeded the Nonresidential Infinite Source Volatile Soil Inhalation Criteria (VSIC), representing a potential exposure pathway to occupants of the future Operations Building.
- Several SVOCs were detected in groundwater at sample locations TW-06, TW-20, and TW-80 at concentrations which exceeded Water Solubility Screening Levels. These locations correspond to beneath the current main building and the former bus storage area in the eastern portion of the Subject Property. Two SVOCs, fluoranthene and pyrene, were detected in groundwater at sample location TW-06 at concentrations which exceeded the EGLE Non-Residential

Groundwater Volatilization to Indoor Air Inhalation Criteria (GVIAC), representing a potential exposure pathway to occupants of the Operations Building which is planned for that location.

Based on the data collected as part of this Phase II ESA, subsurface soils at the Subject Property contain contaminants at concentrations which exceed EGLE Part 201 Residential Generic Cleanup Criteria and Screening Levels. As a result, the subject property is defined as a “facility” by Section 20101(1)(r) of Michigan’s Natural Resources Environmental Protection Act, 1994 Public Act 451, as amended (NREPA). A “facility” is defined as: "any area, place or property where a hazardous substance in excess of the concentrations which satisfy the requirements of section 20120a(1)(a) or (17) has been released, deposited, disposed of, or otherwise comes to be located."

Based on the conclusions drawn from an evaluation of the data collected as part of the Phase II ESA, the following recommendations are presented:

- Due to documented soil and groundwater contamination throughout the subsurface of the Subject Property, a Soil and Groundwater Management Plan should be developed to provide direction for soil and groundwater removal, relocation and disposal options, and to minimize risk associated with worker exposure during redevelopment of the Subject Property. The Soil and Groundwater Management Plan would likely include information related to the site background and history, as well as protocol for soil and groundwater handling to ensure work performed at the Subject Property (i.e., demolition, grading, construction of buildings and stormwater infrastructure) does not cause exacerbation of existing contamination. Such protocol would include provisions for risk mitigation, soil and water management, and equipment decontamination.
- All wastes including contaminated soil and groundwater generated at the Subject Property shall be characterized in accordance with applicable federal, state, and local regulations and disposal facility requirements, and disposed offsite or be relocated on site as detailed in the Soil and Groundwater Management Plan. This may include over-excavation of impacted soils and replacement with clean soil, as part of the construction/installation of stormwater management infrastructure (e.g., bioswales, detention/retention basins, conveyance piping, etc.) to minimize the risk of cross-contamination of newly imported material, and to reduce potential for stormwater that enters the constructed infrastructure to contact contaminated soils and groundwater.
- The stormwater management infrastructure shall be designed to minimize or eliminate infiltration of contaminated groundwater into system infrastructure. Obtain an applicable stormwater discharge permit, as necessary, for any stormwater that is discharged from the stormwater management system to a publicly owned treatment works via a sanitary or combined sewer discharge and/or to a surface water of the state, either directly or indirectly through a public stormwater conveyance system. All applicable permit conditions, including, but not limited to sampling and discharge limit requirements, shall be complied with at all times.
- Based on site contaminants present at the Subject Property, phytoremediation may be considered for incorporation into stormwater management design. Phytoremediation uses

deep-rooted vegetation including trees such as poplar to draw groundwater up through the plant and through a process known as transpiration, the water is released through the leaves to the atmosphere. During this process, target contaminants such as VOCs are mineralized in the subsurface to gradually reduce contaminant levels over time. By selecting appropriate plantings for areas targeted for construction of stormwater retention features, phytoremediation may offer contaminant reduction as well as stormwater management capacity. Precautionary measures may be warranted, such as the placement of an underdrain system, to capture excess stormwater not otherwise influenced by phytoremediation. This will reduce the accumulation and possible migration of stormwater on top of the clay rich soil across the site.

- Section 20107a of Part 201 of the NREPA specifically requires that owners and operators take Due Care measures to ensure that existing contamination on a property does not cause unacceptable risks and is not exacerbated. Due Care obligations are required for a person who owns or operates property that he or she has knowledge is a “facility”, regardless of whether the person is liable. The Due Care requirements were designed so contaminated properties could be safely redeveloped. Due Care obligations include the following:
 - a) Evaluate Due Care obligations and prepare a Due Care Plan consistent with Section 20107a of Part 201 of the NREPA.
 - b) Prepare a Soil and Groundwater Management Plan for dissemination to contractors that may be exposed to contaminated soil and/or groundwater while working at the Site. The Due Care Plan should be appended or otherwise incorporated into the Soil and Groundwater Management Plan.
 - c) Undertake measures as are necessary to prevent exacerbation of the existing contamination (Refer to recommendations above).
 - d) Exercise due care by undertaking response activities necessary to mitigate unacceptable exposure to hazardous substances, mitigate fire and explosions hazards due to hazardous substances, and allow for the intended use of the facility in a manner that protects the public health and safety, such as by removal of all free-product saturated soil as encountered.
 - e) Take reasonable precautions against the reasonably foreseeable acts or omissions of a third party and the consequences that are foreseeable could result from those acts or omissions.
 1. Ensuring all contractors adhere to the site-specific Soil and Groundwater Management Plan including stormwater management and soil stockpiling provisions;
 2. Verify soil or groundwater waste generated at the Site is properly handled, transported, and disposed;
 3. Determine whether Contractors who may perform work onsite are cognizant of the hazards of the site including explosivity and air quality concerns as well as direct contact, ingestion, and other potential exposure routes. Require contractors completing subsurface work to complete a site-specific Health and Safety Plan consistent with MIOSHA and OSHA requirements;
 4. Other actions as determined applicable by DDOT based on the type of activity planned to be performed at the Subject Property.

1.0 INTRODUCTION

DLZ Michigan, Inc. (DLZ) was retained by the Detroit Building Authority (DBA) to conduct a Supplemental Phase II Environmental Site Assessment (ESA) of the property located at 14044 Schaefer Highway as well as 23 adjoining residential parcels along Compass Street and Ward Avenue in Detroit, Wayne County, Michigan; hereinafter referred to as the Subject Property.

1.1 PURPOSE

This Supplemental Phase II ESA was performed at the request of the DBA to conduct additional assessment of areas throughout the Subject Property that are planned for construction of stormwater infrastructure.

1.2 LIMITATIONS AND EXCEPTIONS

The findings and professional opinions conveyed in this Phase II ESA are in part based upon information obtained by DLZ during completion of the Phase I ESA including historical site information obtained from governmental files and regulatory databases, as well as third parties such as Insite Design. DLZ did not independently verify the accuracy of information obtained, and cannot and does not guarantee its authenticity, accuracy, or reliability.

The professional opinions presented in this report are based on findings of the Phase II ESA itself and include geophysical survey results, subsurface soil characteristics, and soil and groundwater sample analytical results. Professional opinions are limited by the data gathered as part of the Phase II ESA, and as such conditions may be present at the Subject Property (i.e., environmental impact or contamination) that was not discovered during this assessment.

1.3 SPECIAL TERMS AND CONDITIONS

This Phase II ESA was completed in accordance with the Professional Services Contract between the City of Detroit, Detroit Building Authority and DLZ Michigan, Inc. There were no special terms or conditions beyond those agreed to within the Professional Services Contract.

1.4 USER RELIANCE

This Phase II ESA was prepared by DLZ for the exclusive use of the City of Detroit, the Detroit Department of Transportation (DDOT), and the DBA. The findings and professional opinions presented in this report are solely for the use and information of the City of Detroit, DDOT, and the DBA at the time the report was completed and may not be relied upon by third parties. Any reliance on this report by a third party is at such party's sole risk.

The services described in this report were performed consistent with generally accepted practices. No other warranty, express or implied, is made.

2.0 SITE DESCRIPTION

2.1 LOCATION

The project location includes the property located at 14044 Schaefer Highway as well as 23 adjoining residential parcels along Compass Street and Ward Avenue in Detroit, Wayne County, Michigan; hereinafter referred to as the Subject Property. The Subject Property is comprised of 24 parcels across approximately 23 acres including the unused former Coolidge Bus Terminal which sits on approximately 20 acres of land with eight vacant buildings and adjacent residential properties that may be made part of the overall project site in the future. These properties along Compass Street and Ward Avenue include to-be vacated alleyways, and vacated portions of Hartwell Avenue, Kendall Street, and Intervale Street, and are referred to as the Coolidge Bus Terminal Expansion Sites. Addresses and associated Parcel Numbers for the parcels that comprise the Subject Property are included in **Table 1**. A Project Location Map is included as **Figure 1**. A Subject Property layout map, including the Subject Property boundary is presented as **Figure 2**.

2.2 SITE AND VICINITY GENERAL CHARACTERISTICS

The Subject Property is located in an industrial and residential area within the city limits of Detroit. The Subject Property main parcel houses the unused former Coolidge Bus Terminal. The western portion of the main parcel contains an approximately 250,000-square-foot Main Building and parking areas. A former Administrative/Terminal Building is located to the northwest of the Main Building, and to the northeast are the Fare Box Building and Heating Plant Building. Two small guard buildings are located west of the Main Building along Schaefer Highway. Concrete paved areas surround the Main Building, and gravel covered areas are present in the eastern portion of the Subject Property. Abandoned streetcar tracks and a concrete slab from a former building were observed in the east-central portion of the Subject Property during Phase II field activities. The Coolidge Expansion Sites along Ward Avenue and Compass Street, which adjoin the main parcel, contain primarily abandoned or vacant residential parcels. However, an occupied house was present at 13500 Compass Street.

Industrial properties adjoin the Subject Property to the north and west, and residential properties adjoin the Subject Property to the east and south. The Subject Property Main Parcel is owned by the Detroit Department of Street Railways, a predecessor to the Detroit Department of Transportation (DDOT). The adjoining residential Expansion Sites parcels are owned by the Detroit Land Bank. The Subject Property is located adjacent to the south of Frisbie Moving and Storage Company, and to the east of Danny's Used Auto Parts. Residential land uses adjoin the Subject Property to the east and south. The elevation of the property is approximately 645 feet above mean sea level.

2.3 SITE HISTORY

Review of historical records obtained by DLZ during completion of the 2021 Phase I ESA indicate that the Subject Property was historically used as a bus terminal and has been vacant since

approximately January 2012. The southern and eastern portions of the Subject Property (along Ward Avenue and Compass Street) were historically residential dwellings. Prior to the use as a bus terminal, the main portion of the Subject Property was used as a combined streetcar and bus maintenance and storage facility. Activities that occurred at the site included bus refueling, bus washing, bus maintenance, and indoor and outdoor bus storage. The north adjoining property has been industrial in usage since at least 1967. A manufactured gas plant (MGP) was historically located approximately 100 yards north of the Subject Property. The eastern and southern adjoining properties have historically been residential in usage. The western adjoining properties have been industrial in usage since at least 1926.

2.4 PREVIOUS ENVIRONMENTAL ASSESSMENTS

The Michigan Department of Environment, Great Lakes, and Energy (EGLE) Remediation and Redevelopment Division (RRD) provided DLZ with copies of prior assessment reports completed on the Subject Property. This section details the findings of those reports.

Between 1999 and 2003, the Traverse Group completed several environmental investigations at the main parcel of the Subject Property, including an Initial Assessment, a Final Assessment, and two quarterly free product monitoring events. Throughout these investigations, The Traverse Group advanced 41 soil borings and installed seven temporary and nine permanent monitoring wells. These investigations determined that contamination had migrated off the site to the northern adjoining property, directly north of the former underground storage tanks.

Subsequently, during a groundwater sampling event in April of 2003, approximately 1.08 inches of petroleum free product was found in one monitoring well (MW-15) north of the Main Building. The free product thickness was monitored for six months, in ten separate events, and ranged between 0.12 and 2.76 inches at MW-15. Monitoring was terminated when product thickness was last recorded at 0.24 inches in October 2003. Free product was also monitored, but not detected in six other monitoring wells (four off-site at the adjacent Frisbee property to the north, and two on-site). According to the Amended Final Assessment Report (AFAR), a total of 6,260 cubic yards of soil, 2,800 gallons of contaminated groundwater, and approximately 272 gallons of free product were removed and disposed off-site during various site activities, including the closure of the former USTs and installation of the new USTs and communications line. A feasibility analysis was performed as documented in the AFAR, which recommended installation of bioremediation systems as the appropriate corrective action for the site, to address remaining contamination north and east of the Main Building. No documentation supporting construction of such systems was discovered during completion of the DLZ Phase I ESA.

In October of 2011, Gannett Fleming was retained by EGLE-RRD to complete additional environmental studies at the site. In January and February of 2012, they advanced 30 soil borings (for a total of 58 soil samples) on the Subject Property and installed three temporary monitoring wells. Gannett Fleming also located and sampled three of the four existing permanent monitoring wells on the Subject Property, although they were unable to locate the monitoring well where free product was discovered in the environmental assessment completed

by The Traverse Group in 2003. Fourteen of the thirty soil borings contained concentrations of volatile organic compounds (VOCs) and/or polynuclear aromatic hydrocarbons (PNAs) above Michigan Part 213 Risk Based Screening Levels (RBSLs) for relevant pathways. Two soil samples also exceeded the soil volatilization to indoor air inhalation and soil saturation concentration screening levels. All other samples only exceeded the groundwater-surface water interface RBSL. Most exceedances were collected from the upper 2 to 6 feet of fill material or from the shallowest part of the clay unit. One sample was analyzed for diesel and oil range organics. Only one groundwater sample collected in January/February 2012 had concentrations of any compounds above RBSLs. In the August sampling event, two groundwater samples had detectable petroleum hydrocarbon compounds. Both of these samples were collected on the northern adjacent property. One of these samples did not exceed RBSLs, and the other sample only exceeded the groundwater-surface water interface RBSL.

Given the existing land use, and the stable and immobile nature of the soil and groundwater contaminants, Gannett Fleming recommended Monitored Natural Attenuation (MNA) with appropriate due care provisions as the most feasible remedial option for the Subject Property. Recommendations for compliance with due care included additional investigation to determine whether storm water sewers in proximity to contaminated soil and groundwater create a preferential pathway and therefore pose a groundwater/surface water interface (GSI) risk; and evaluation of indoor air quality related to potential vapor intrusion from nearby contaminated soil and groundwater.

On March 12, 2013, Gannett Fleming installed five sub-slab soil gas sampling points to evaluate vapor intrusion risks. All five points were located within the bus refueling area at the north portion of the Main Building. The sampling was conducted to evaluate if there was an indoor air inhalation risk to users in the building due to potential residual contaminants in soil. Petroleum and chlorinated VOCs were detected in all five soil samples but none of the concentrations exceeded applicable draft Michigan Department of Environmental Quality (now EGLE) Sub-Slab Industrial Acceptable Soil Gas Screening Concentrations (June 2008). The benzene concentration in SGP-2 (2,200 ug/m³) was equal to the applicable RBSL at the time of sampling. The benzene concentration at SGP-2 exceeds the current Nonresidential Volatilization to Indoor Pathway screening level (260 ug/m³) for soil vapor.

On November 25, 2013, Gannett Fleming installed an additional six sub-slab sampling points in the southeast corner of the Terminal Building on the northwest corner of the Subject Property. The samples were to be collected from the basement floor to determine whether there was an indoor air inhalation risk to building users based on residual contamination in soil or groundwater. When Gannett Fleming returned on November 26th, 2013 to collect the samples, five of the samples could not be collected because water had infiltrated the air sampling apparatus. A sixth vapor point was also unable to be sampled, likely due to low porosity caused by either tight clay immediately below the concrete or water filling the pores. Additionally, Gannett Fleming noticed a dark viscous material floating on the surface of the water in the basement sump on a November 15, 2013 site visit. The thickness of the material was measured at 0.02 inches.

According to drawings provided to DLZ by EGLE-RRD, underground storage tanks were formerly located west, north, and east of the Main Building at the Subject Property (Refer to **Figure 3**). Aboveground storage tanks were also formerly located north of the Main Building. Two oil water separators were shown to the east and northwest of the Gas House, respectively. Tanks historically located onsite contained a variety of fuels and lubricants (i.e., diesel, engine oil, gasoline, waste oil, heating oil, etc.) and ranged in size from 500 gallons to 50,000-gallons. A total of 19 USTs were removed or closed-in-place at the Subject Property in late 1999 and early 2000. Six new tanks were subsequently installed in the northern portion of the Subject Property in 2001 and remain in-place (**Figure 3**). These include four 25,000-gallon diesel tanks, one 10,000-gallon gasoline tank, one 1,000-gallon used oil tank, and a possible 550-gallon tank.

Five confirmed releases have been reported at the Subject Property, including three in 1999, one in 2000, and one in 2006. The 1999 confirmed releases were identified during construction activities related to underground storage tank removal and/or closure. The confirmed release in 2000 occurred when a diesel transfer pipe failed near the northwest portion of the Main Building. The confirmed release in 2006 was due to a leaking diesel fuel clamp.

A Phase I ESA was conducted on the 20-acre main parcel of the Subject Property by DLZ in October 2019, and a Phase I ESA was later conducted by DLZ on the expanded approximately 23-acre Subject Property on August 27, 2021. In the August 2021 Phase I ESA, several Recognized Environmental Conditions (RECs) were identified and recommended for further investigation. The RECs identified during the August 2021 Phase I ESA included:

- The historical use of the Subject Property for bus maintenance and outdoor bus storage;
- The current and former presence of USTs, ASTs, vaults, and/or oil/water separators on the Subject Property, including approximately 800 gallons of standing diesel fuel discovered within the pump house “aqua system vault” during a December 1994 inspection by the Detroit Fire Department;
- Five confirmed releases reported at the Subject Property resulting in soil and groundwater contamination on the Subject Property and the presence of elevated concentrations of contaminants in the soil and groundwater at the Subject Property at levels that exceed EGLE Part 201 Residential Generic Cleanup Criteria and Screening Levels;
- The phenol-type odor and oily water in pits in the north-central portion of the Main Building;
- The historical industrial uses of the adjoining properties to the north and west; and,
- The former MGP site located approximately 300 feet north of the Subject Property.

Historical documents and drawings are provided in the August 27, 2021, Phase I ESA prepared by DLZ.

3.0 FIELD INVESTIGATION

DLZ prepared a Site-Specific Health and Safety Plan (HASP) prior to initiation of Phase II field activities at the Subject Property. Phase II ESA Work Plans were also submitted to the City of Detroit Building Authority (DBA) for review and approval prior to mobilization. During the Phase II ESA, a total of 81 soil borings were advanced at the Subject Property. DLZ also collected surface soil samples from the ground surface to two feet bgs at twelve locations and collected samples of stockpiled soils at four locations to provide waste characterization for possible future disposal. A total of twelve groundwater samples were collected from temporary monitoring wells installed within soil borings at the Subject Property.

Phase II ESA field activities are further described in the following sections.

3.1 SOIL INVESTIGATION

Prior to advancement of soil borings at the Subject Property, a subsurface survey was performed to evaluate for the absence or presence of subsurface features and/or utilities in the vicinity of proposed drilling/boring locations. Utility clearance was performed using electromagnetic (EM) and ground penetrating radar (GPR) methods, as appropriate.

Initial Phase II ESA field activities were performed at the 20-acre main parcel of the Subject Property between November 13 and November 26, 2019 to investigate the findings, including RECs, of the October 2019 Phase I ESA. During the initial Phase II ESA, 42 soil borings were advanced at the main parcel of the Subject Property. Then, to further characterize subsurface soils at the Subject Property, including the 23 adjoining residential parcels, DLZ performed Supplemental Phase II ESA field activities between January 25 and February 9, 2022. Specifically, the Supplemental Phase II ESA was intended to further characterize subsurface soil and groundwater within areas proposed for construction of bioswales or other stormwater management infrastructure.

During the Supplemental Phase II ESA, a total of 39 soil borings were advanced at the Subject Property. 14 soil borings were advanced on the Coolidge Expansion Sites along Compass Street and Ward Avenue, and 25 soil borings were advanced on the main parcel of the Subject Property. The 14 Expansion Sites soil borings (SB-43 to SB-56) and 25 Stormwater Management Areas soil borings (SB-57 to SB-81) were generally advanced to depths ranging from 10 to 15 feet below ground surface (bgs). At each soil boring location, continuous soil samples were collected using direct push technology (DPT) drilling methods. A DLZ geologist/scientist examined all soil samples and classified the samples in general accordance with the Unified Soil Classification System (USCS), including as applicable: soil type, grain size, color, relative moisture content, and any other notable features. The soil samples were screened for organic vapors using a calibrated photoionization detector (PID) with a 10.6 ev lamp and all readings were recorded on the soil boring logs. Any odors, staining, discoloration, or other pertinent observations about the soils recovered were also noted on the soil boring logs. The 81 soil borings (SB-01 to SB-81) were generally advanced to depths ranging from 10 to 15 feet below ground surface (bgs), although shallow refusal prohibited deeper exploration at sample locations SB-07, SB-14, SB-64, SB-65, and SB-66. One to two soil samples were collected from

each of the 81 soil borings for laboratory analysis. The soil samples collected for laboratory analysis were collected at the boring interval with the highest PID reading (i.e. most likely impacted), or using professional judgement if no PID readings, staining or odors were observed. Soil samples were also collected from the ground surface to two ft bgs at 12 locations for shallow soil waste profiling. Additionally, soil samples were collected from stockpiled soils at four locations to facilitate waste disposal for future site redevelopment. Samples were placed on ice and transported to the analytical laboratory for analysis. Laboratory analyses and methods are discussed in **Section 3.3**.

Soil boring logs are provided in **Appendix A**. Soil boring locations are presented on **Figure 4**.

3.2 GROUNDWATER INVESTIGATION

Temporary monitoring wells were installed at twelve of the 81 soil boring locations, corresponding to locations where groundwater was encountered during drilling in volumes sufficient for sampling. Temporary wells were installed at soil boring locations SB-01, SB-06, SB-08, SB-09, SB-15, SB-20, SB-27, SB-33, SB-62, SB-67, SB-73, and SB-80. One water sample was collected from each of the twelve temporary monitoring wells in general accordance with low-flow (minimal drawdown) sampling procedures, as described in EGLE's Operational Memorandum No. 2 – Attachment 5, "Collection of Samples for Comparison to Generic Criteria", and the U.S. Environmental Protection Agency (USEPA) publication Low-Flow (Minimal Drawdown) Groundwater Sampling Procedures, EPA/540/S-95/504, April 1996. Samples were placed on ice and transported to the analytical laboratory for analysis. Laboratory analyses and methods are discussed in **Section 3.3**.

3.3 LABORATORY ANALYSIS

Soil samples were delivered under standard Chain-of-Custody procedures to Fibertec Environmental Services Laboratory (Fibertec) in Holt, Michigan or ALS Group, USA in Holland, Michigan for analysis. Soil samples from soil borings were analyzed for parameters designed to determine if contaminant concentrations in soil exceed Part 201 Screening Levels.

Soil samples collected from future Coolidge Expansion Sites were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), Michigan 10 metals (arsenic, barium, cadmium, chromium, copper, lead, mercury, selenium, silver, and zinc), and polychlorinated biphenyls (PCBs). Soil samples collected from future Stormwater Management Areas (collected from the Main Parcel) were analyzed for VOCs, SVOCs, and Michigan 10 metals. Discrete soil samples were submitted for the analysis according to the following methods:

- VOCs (EPA Method 8260)
- SVOCs (EPA Method 8270)
- Michigan 10 metals (Methods 6010 and 7470)
- PCBs (EPA Method 8082)

For waste characterization purposes, to facilitate disposal of shallow site soils during construction, shallow composite soil samples were collected from the ground surface to two ft bgs at 12 locations. Four stockpiled soil samples were also collected for waste characterization. Waste characterization composite soil samples were analyzed for either VOCs, SVOCs, Resource Conservation and Recovery Act (RCRA) 8 metals (arsenic, barium, cadmium, chromium, lead, selenium, silver, and zinc) and PCBs, or Toxicity Characteristic Leaching Procedure (TCLP) VOCs, TCLP SVOCs, TCLP RCRA 8 metals, and PCBs. Waste characterization soil samples were couriered under standard Chain-of-Custody procedures for analysis. Waste characterization composite soil samples were submitted for the analysis according to the following methods:

- VOCs (EPA Method 8260) or TCLP (EPA Method 1355) VOCs
- SVOCs (EPA Method 8270) or TCLP SVOCs
- RCRA 8 Metals (Methods 3005A and 6020A)
- PCBs (EPA Method 8082)

Groundwater samples were couriered under standard Chain-of-Custody procedures to Fibertec or ALS for analysis. Groundwater samples were analyzed for parameters designed to determine if contaminant concentrations in groundwater exceed Part 201 Screening Levels. Groundwater samples were analyzed for total VOCs, SVOCs, Michigan 10 metals, and PCBs according to the following methods:

- VOCs (EPA Method 8260)
- SVOCs (EPA Method 8270)
- Michigan 10 Metals (Methods 6010 and 7470)
- PCBs (EPA Method 8082)

3.6 INVESTIGATION-DERIVED WASTE

Investigation-Derived Waste generated during the Phase II ESA consisted of disposable materials such as acetate liners, soil coring tools, and personal protective equipment (PPE). Development water or purged water was containerized and returned to the borehole or containerized in an appropriately labeled, MDOT-approved, 55-gallon drum and staged at the site for future disposal. Excess drill cuttings were returned to the borehole or containerized in an appropriately labeled, MDOT-approved, 55-gallon drum and staged at the site for future disposal. Minimally contaminated disposable sampling materials and PPE were containerized and disposed off-site as ordinary solid waste. A total of one drum of soil cuttings and one drum of purged groundwater was generated during Phase II field activities and were labelled and staged within the western portion of the Gas House for future disposal.

4.0 GEOLOGY

Geologic maps of Michigan showing the bedrock and glacial geology of the state were reviewed on the Michigan Department of Environment, Great Lakes, and Energy's GeoWebFace website and in the Hydrogeologic Atlas of Michigan (Western Michigan University, 1981). The bedrock map indicates that the bedrock in the general site vicinity consists of the Middle Devonian age Antrim Shale. The glacial map indicates that glacial deposits in Wayne County near the Subject Property generally exceed 100 feet in thickness and consist primarily of lacustrine clay and silt deposits, with some inconsistent lenses of lacustrine sand and gravel. A shallow drinking water aquifer in the glacial sediments is not present in the vicinity of the City of Detroit.

No water wells or Wellhead Protection Areas were observed in the general vicinity of the Subject Property on the GeoWebFace Map. The nearest surface water body is the Rouge River which is located approximately 3.7 miles south-southwest of the Subject Property.

Shallow subsurface soils at the Site generally consist of sand with some gravel and debris/bricks/concrete (fill) from ground surface to approximately 4-5 feet bgs across the site. Below shallow subsurface soils, the Site generally consists of native medium stiff to stiff clay, silty clay or sandy clay to depths of 7-9 feet bgs, followed by a stiff to very stiff mottled clay to 12-14 feet bgs, and soft to stiff gray clay with high plasticity to a terminal depth of 15 feet bgs, with the exception of the central and northern sections of the Site where soils have been disturbed and backfilled with sand. Water was encountered sporadically across the site at varying depths ranging from 4 to 11 feet bgs.

5.0 EVALUATION OF ANALYTICAL RESULTS

Discrete soil sample laboratory analytical results were compared to the Natural Resources and Environmental Protection Act (NREPA), 1994 PA 451, as amended, Part 201 Generic Cleanup Criteria and Screening Levels revised June 25, 2018 and further detailed below. DLZ compared the soil and groundwater data to Generic Non-Residential Criteria and Risk-Based Screening Levels (RBSLs) due to the planned future nonresidential use of the Subject Property. Soil samples were compared to:

- Groundwater Surface Water Interface Protection (GSIP) Criteria and RBSLs;
- Nonresidential Soil Volatilization to Indoor Air Inhalation Criteria (SVIIC) and RBSLs;
- Nonresidential (Ambient Air) Volatile Soil Inhalation Criteria (VSIC) and RBSLs for 2-meter, 5-meter, and infinite source thicknesses;
- Nonresidential Particulate Soil Inhalation Criteria (PSIC) and RBSLs;
- Nonresidential Direct Contact (DC) Criteria and RBSLs; and,
- Nonresidential Soil Volatilization to Indoor Air Pathway (VIAP) Screening Levels.

Groundwater samples were compared to:

- Groundwater Surface Water Interface (GSI) Criteria and RBSLs;

- Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria (GVIIC) and RBSLs;
- Water Solubility Screening Levels;
- Flammability and Explosivity Screening Levels; and,
- Nonresidential Volatilization to Indoor Air Pathway (VIAP) Screening Levels for shallow groundwater.

DLZ also compared metal concentrations in soil samples to Part 201 Statewide Default Background Levels. In accordance with Part 201 Screening Level guidelines, contaminant concentrations less than Statewide Default Background levels were not considered to exceed Part 201 Screening Levels. Drinking Water Protection Criteria were not evaluated as there are no usable aquifers within the City of Detroit, and the drinking water pathway is not considered relevant. GSIP and GSI Criteria were evaluated due to the potential impact of existing contamination on future construction of stormwater infrastructure, as otherwise there are no surface water bodies near the Subject Property and those criteria would likely not apply.

Soil sample analytical results for discrete samples are summarized in **Table 2**. Soil sample analytical results for composite (waste characterization) samples are summarized in **Table 3**. Groundwater sample analytical results are summarized in **Table 4**. Laboratory analytical reports are provided in **Appendix B**.

Contaminant concentrations exceeding Part 201 Screening Levels are summarized below:

- Soil sample results representing exceedances of EGLE GSIP Criteria for metals, SVOCs, and VOCs were generally observed throughout the entirety of the Subject Property, except for isolated areas beneath the Main Building, Heating Plant Building, and residential areas along Ward Avenue and Compass Street. Some areas including beneath the Main Building and eastern portion of the Subject Property were assumed to contain GSIP exceedances due to exceedances observed at nearby data points, as well the overall preponderance of GSIP exceedances across the Subject Property. Of the 129 total soil samples collected, 102 samples exceeded GSIP Criteria for metals, 26 samples exceeded GSIP Criteria for SVOCs, and 25 samples exceeded GSIP Criteria for VOCs. The most common GSIP exceedances were due to elevated concentrations of arsenic and lead.
- The soil sample result from one soil sample (SB-20 [1-2']) exceeded the EGLE GSIP and NDC Criteria for arsenic. This sample location is beneath the planned future Bus Storage Building in the east-central portion of the Subject Property.
- The soil sample result from one soil sample (SB-18 [1-2']) exceeded the EGLE GSIP, Nonresidential Direct Contact (NDC), and Particulate Soil Inhalation Criteria (PSIC) for lead. This sample location is beneath the planned future Fleet Maintenance Building in the northeast portion of the Subject Property.
- The soil sample results from seven soil samples (SB-02 [1-2']), (SB-06 [3-4']), (SB-06 [4-5']), (SB-07 [1-2']), SB-22 [1-2']), SB-63 [2-3'], and SB-81 [2-3'] exceeded the EGLE NDC for SVOCs including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and/or indeno(1,2,3-cd)pyrene. These sample locations are located beneath the planned future

Operations Building, as well as scattered throughout the eastern portion of the Subject Property.

- The soil sample result from one soil sample (SB-06 [3-4']) exceeded the EGLE Nonresidential Infinite Source Volatile Soil Inhalation Criteria (VSIC) for dibenzofuran and phenanthrene. This sample was collected from beneath the planned future Operations Building.
- The soil sample results from seven soil samples (SB-02 [1-2'], SB-06 [3-4'], SB-06 [4-5'], SB-07 [1-2'], SB-27 [9-10'], SB-57 [3-4'], SB-63 [2-3'], SB-73 (2-3'), SB-73 (3-4'), SB-75 (3-4'), and SB-81 [2-3']) exceeded the EGLE Nonresidential Soil Volatilization to Indoor Air Pathway (VIAP) Screening Levels for SVOCs including 2-methylnaphthalene, naphthalene, and/or phenanthrene.
- The soil sample results from 27 soil samples collected exceeded the EGLE Non-Residential Soil Volatilization to Indoor Air Pathway (VIAP) Screening Levels. These locations generally overlapped with areas of VOC and SVOC contamination described above.
- The groundwater sample results from eight groundwater samples (TW-01, TW-06, TW-08, TW-15, TW-20, TW-27, TW-33, and TW-73) exceeded the EGLE GSI for various metals arsenic and/or selenium, a variety of SVOCs including fluoranthene, fluorene, 2-methylnaphthalene, and/or phenanthrene, as well as VOCs including ethylbenzene, naphthalene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and/or xylenes.
- Several SVOCs were detected in groundwater at sample locations TW-06, TW-20, and TW-80 at concentrations which exceeded Water Solubility Screening Levels. Two SVOCs, fluoranthene and pyrene, were detected in groundwater at sample location TW-06 at concentrations which exceeded the EGLE Non-Residential Groundwater Volatilization to Indoor Air Inhalation Criteria (GVIAC).

A map depicting locations of soil samples that exceeded relevant criteria for metals is provided as **Figure 5**. A map depicting locations of soil samples that exceeded relevant criteria for SVOCs is included as **Figure 6**, and a map depicting locations of soil samples that exceeded relevant criteria for VOCs is included as **Figure 7**. A map depicting areas where groundwater is anticipated to be present onsite based on locations it was encountered is provided as **Figure 8** and locations of groundwater samples that exceed relevant criteria for groundwater is provided as **Figure 9**.

6.0 SUMMARY AND CONCLUSIONS

DLZ completed this Phase II ESA at the request of the DBA to conduct additional assessment of areas throughout the Subject Property that are planned for construction of stormwater infrastructure. Based on the data collected as part of this Phase II ESA, stormwater management infrastructure design may be influenced by existing soil and groundwater contamination at the Subject Property. Subsurface soil and groundwater at the Subject Property contains contaminants at concentrations which exceed EGLE Part 201 Nonresidential Generic Cleanup Criteria and Screening Levels. As a result, the subject property is defined as a "facility" by Section 20101(1)(r) of Michigan's Natural Resources Environmental Protection Act, 1994 Public Act 451, as amended (NREPA). A "facility" is defined as: "any area, place or property

where a hazardous substance in excess of the concentrations which satisfy the requirements of section 20120a(1)(a) or (17) has been released, deposited, disposed of, or otherwise comes to be located."

Specific findings of this Phase II ESA include the following:

- Metals, VOCs, and/or SVOCs were detected in soil samples throughout the Site that exceeded the Groundwater Surface Water Interface Protection (GSIP) Criteria. Select locations as shown on the attached **Figure 5** through **Figure 7** also exceeded the Nonresidential Direct Contact (DC) Criteria. These contaminants could leach from existing soil and/or groundwater to stormwater within newly installed management infrastructure if not properly addressed during stormwater design, as well as create a worker exposure pathway during construction, respectively.
- SVOCs and VOC concentrations in soil exceeded the Nonresidential Soil Volatilization to Indoor Air Pathway (VIAP) Screening Levels at locations as shown on **Figure 6** and **Figure 7**, indicating potential indoor air inhalation pathways. At sample location SB-06, beneath the proposed location of the future Operations Building, SVOCs dibenzofuran and phenanthrene were detected in shallow soil at concentrations which exceeded the Nonresidential Infinite Source Volatile Soil Inhalation Criteria (VSIC), representing a potential exposure pathway to occupants of the future Operations Building;
- Several SVOCs were detected in groundwater at sample locations TW-06, TW-20, and TW-80 at concentrations which exceeded Water Solubility Screening Levels. These locations correspond to beneath the current main building and the former bus storage area in the eastern portion of the Subject Property. Two SVOCs, fluoranthene and pyrene, were detected in groundwater at sample location TW-06 at concentrations which exceeded the EGLE Non-Residential Groundwater Volatilization to Indoor Air Inhalation Criteria (GVIAC), representing a potential exposure pathway to occupants of the Operations Building which is planned for that location.

It should be noted that GSI Criteria were developed by the Michigan Department of Environmental Quality (MDEQ), a predecessor to EGLE, to protect surface waters of the state of Michigan. The nearest surface water to the Subject Property is believed to be the Rouge River, which is approximately 4 miles west of the Subject Property. Although GSI is not considered relevant at the Subject Property due to the lack of nearby surface water to which site contamination could reasonably be expected to vent, those criteria are provided due to lack of other relevant criteria for stormwater design purposes. According to the EGLE Remediation and Redevelopment Division guidance document titled "Groundwater-Surface Water Interface Pathway Compliance Options" from April 2018, the GSI pathway is considered relevant when "a remedial investigation or application of best professional judgement leads to the conclusion that a hazardous substance in groundwater can be reasonably expected to vent to surface waters of the state in concentrations that exceed the generic GSI criteria currently or in the future." The Water Resources Division (WRD) of EGLE determines whether a water body is considered a surface water of the state.

Unlike GSI/GSIP which are intended to be protective of the environment, DC Criteria are intended to be protective of human health. According to the MDEQ Part 201 Generic Soil Direct Contact Criteria Technical Support Document dated January 5, 2001, direct contact criteria represent a soil

concentration that is protective against adverse health effects due to long-term ingestion of and dermal contact with contaminated soil.

According to EGLE, “Vapor intrusion is the process of vapors migrating from volatile chemicals in contaminated soil or ground water through subsurface soils and/or preferential pathways (such as underground utilities) and impacting the indoor air quality of any overlying buildings. The volatilization to indoor air pathway (VIAP) is the exposure pathway that evaluates the risk posed from vapor intrusion and direct volatilization”. Similarly, VSIC and GVIAC criteria also relate to indoor air hazards related to subsurface contamination. The VSIC are protective of long-term, systemic health effects resulting from ambient air inhalation exposure due to contaminants in soil, whereas GVIAC are protective of long-term, systemic health effects resulting from ambient air inhalation exposure due to contaminants in groundwater.

7.0 RECOMMENDATIONS

Based on the conclusions drawn from an evaluation of the data collected as part of the Phase II ESA, the following recommendations are presented:

- Due to documented soil and groundwater contamination throughout the subsurface of the Subject Property, a Soil and Groundwater Management Plan should be developed to provide direction for soil and groundwater removal, relocation and disposal options, and to minimize risk associated with worker exposure during redevelopment of the Subject Property. The Soil and Groundwater Management Plan would likely include information related to the site background and history, as well as protocol for soil and groundwater handling to ensure work performed at the Subject Property (i.e., demolition, grading, construction of buildings and stormwater infrastructure) does not cause exacerbation of existing contamination. Such protocol would include provisions for risk mitigation, soil and water management, and equipment decontamination.
- All wastes including contaminated soil and groundwater generated at the Subject Property shall be characterized in accordance with applicable federal, state, and local regulations and disposal facility requirements, and disposed offsite or be relocated on site as detailed in the Soil and Groundwater Management Plan. This may include over-excavation of impacted soils and replacement with clean soil, as part of the construction/installation of stormwater management infrastructure (e.g., bioswales, detention/retention basins, conveyance piping, etc.) to minimize the risk of cross-contamination of newly imported material, and to reduce potential for stormwater that enters the constructed infrastructure to contact contaminated soils and groundwater.
- The stormwater management infrastructure shall be designed to minimize or eliminate infiltration of contaminated groundwater into system infrastructure. Obtain an applicable stormwater discharge permit, as necessary, for any stormwater that is discharged from the stormwater management system to a publicly owned treatment works via a sanitary or combined sewer discharge and/or to a surface water of the state, either directly or indirectly

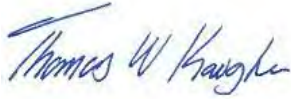

through a public stormwater conveyance system. All applicable permit conditions, including, but not limited to sampling and discharge limit requirements, shall be complied with at all times.

- Based on site contaminants present at the Subject Property, phytoremediation may be considered for incorporation into stormwater management design. Phytoremediation uses deep-rooted vegetation including trees such as poplar to draw groundwater up through the plant and through a process known as transpiration, the water is released through the leaves to the atmosphere. During this process, target contaminants such as VOCs are mineralized in the subsurface to gradually reduce contaminant levels over time. By selecting appropriate plantings for areas targeted for construction of stormwater retention features, phytoremediation may offer contaminant reduction as well as stormwater management capacity. Precautionary measures may be warranted, such as the placement of an underdrain system, to capture excess stormwater not otherwise influenced by phytoremediation. This will reduce the accumulation and possible migration of stormwater on top of the clay rich soil across the site.
- Section 20107a of Part 201 of the NREPA specifically requires that owners and operators take Due Care measures to ensure that existing contamination on a property does not cause unacceptable risks and is not exacerbated. Due Care obligations are required for a person who owns or operates property that he or she has knowledge is a “facility”, regardless of whether the person is liable. The Due Care requirements were designed so contaminated properties could be safely redeveloped. Due Care obligations include the following:
 - a) Evaluate Due Care obligations and prepare a Due Care Plan consistent with Section 20107a of Part 201 of the NREPA
 - b) Prepare a Soil and Groundwater Management Plan for dissemination to contractors that may be exposed to contaminated soil and/or groundwater while working at the Site. The Due Care Plan should be appended or otherwise incorporated into the Soil and Groundwater Management Plan.
 - c) Undertake measures as are necessary to prevent exacerbation of the existing contamination (Refer to recommendations above).
 - d) Exercise due care by undertaking response activities necessary to mitigate unacceptable exposure to hazardous substances, mitigate fire and explosions hazards due to hazardous substances, and allow for the intended use of the facility in a manner that protects the public health and safety, such as by removal of all free-product saturated soil as encountered.
 - e) Take reasonable precautions against the reasonably foreseeable acts or omissions of a third party and the consequences that are foreseeable could result from those acts or omissions.
 1. Ensuring all contractors adhere to the site-specific Soil and Groundwater Management Plan including stormwater management and soil stockpiling provisions;
 2. Verify soil or groundwater waste generated at the Site is properly handled, transported, and disposed;
 3. Determine whether Contractors who may perform work onsite are cognizant of the hazards of the site including explosivity and air quality concerns as well as direct contact, ingestion, and other potential exposure routes. Require contractors

completing subsurface work to complete a site-specific Health and Safety Plan consistent with MIOSHA and OSHA requirements;

4. Other actions as determined applicable by DDOT based on the type of activity planned to be performed at the Subject Property.

Concentrations are reported in micrograms per kilogram (µg/Kg)

Concentrations less than the Statewide Default Background Levels are not indicated as exceedances

Grey shaded cells indicate compound was detected

Green shaded cells indicate an exceedance of Groundwater Surface Water Interface Protection Criteria

Yellow shaded cells indicate an exceedance of Nonresidential Soil Volatilization to Indoor Air Inhalation Criteria

Blue shaded cells indicate an exceedance of Infinite Source Soil Volatile Inhalation Criteria, Finite VSIC for 5 Meter Source Thickness, and/or Finite VSIC for 2 Meter Source Thickness

Orange shaded cells indicate an exceedance of Nonresidential Direct Contact Criteria

Italic text indicates an exceedance of Particulate Soil Inhalation Criteria

Red text indicates an exceedance of Non-Residential Soil Volatilization to Indoor Air Pathway (VIAP) Screening Levels

ID - Insufficient data to develop criterion

NA - Not applicable or not available

NLV - Hazardous substance is not likely to volatilize under most conditions

NLL - Hazardous substance is not likely to leach under most conditions

(B) - Background may be substituted if higher than the calculated cleanup criterion

(C) - Calculated criterion exceeds the chemical-specific soil saturation screening level

(D) - Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 ppb

(DD) - Hazardous substance causes developmental effects

(EE) - The acceptable air concentration (AAC) for the volatile hazardous

(G) - GSI criterion depends on the pH or water hardness, or both, of the receiving surface water. Due to the lack of a final chronic value (FCV) or wildlife value (WV), the Human Non-Drinking Water Value (HNDV) is shown.

(I) - Hazardous substance may exhibit the characteristic of ignitability

(J) - Hazardous substance may be present in several isomer forms

(M) - Site-specific criterion may be below target detection limits

(Q) - Criteria for carcinogenic polycyclic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene

(T) - Refer to federal Toxic Substances Control Act (TSCA) to determine TSCA cleanup standards

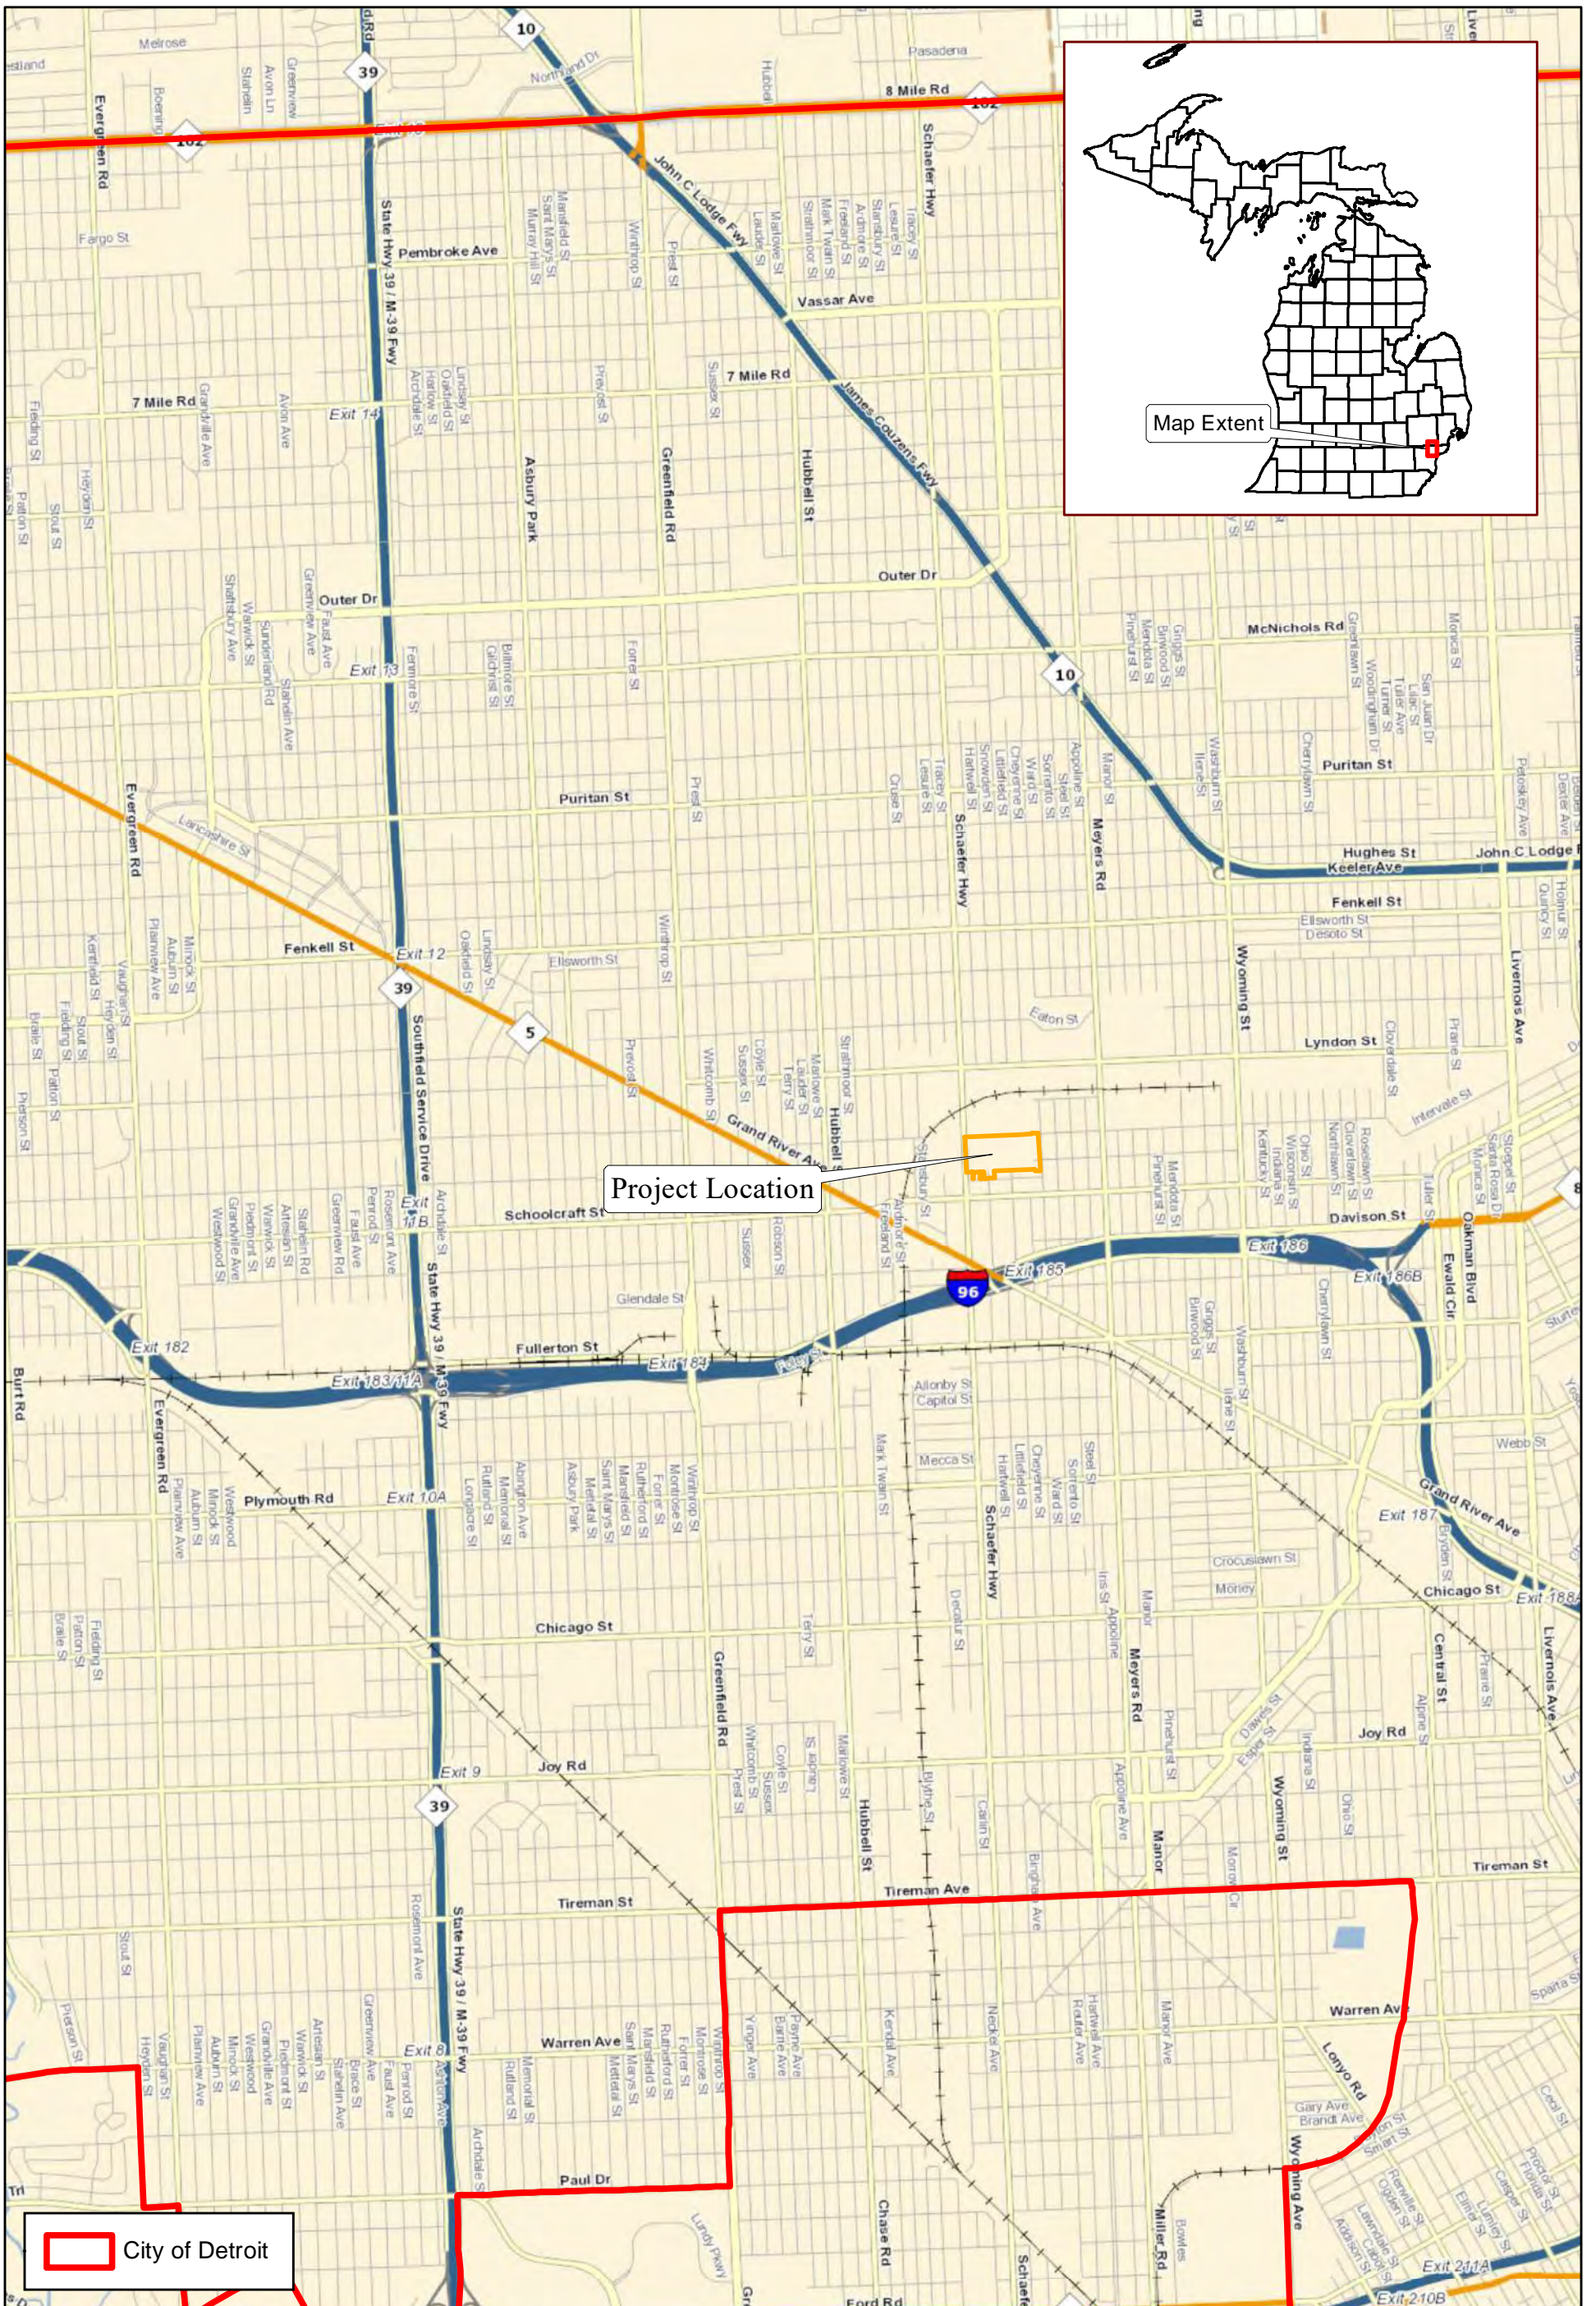

(X) - The GSI criterion is not protective of surface water that is used as a drinking water source

Notes:
Only detected analytes or compounds are listed
Concentrations are in micrograms per liter (µg/L)
Grey shaded cells indicates compound was detected
Blue shaded cells indicate an exceedance of Groundwater Surface Water Interface Criteria
Orange shaded cells indicate an exceedance of the Non-Residential Groundwater Volatilization to Indoor Air Inhalation Criteria (GVIAIC)
Purple shaded cells indicate an exceedance of the Water Solubility Screening Level
Red text indicates an exceedance of the VIAP
ID - Insufficient data to develop criterion
NA - Not applicable
NCE - No criteria established
NLV - Hazardous substance is not likely to volatilize under most conditions
- Not sampled or not analyzed
(B) - Background may be substituted if higher than the calculated cleanup criterion
(I) - Hazardous substance may exhibit the characteristic of ignitability
(G) - GSI criterion calculated per Generic Facility-Specific Part 201 calculation using generic default values. Metals values shown reference the Human Non Drinking Water Value (HNDV) listed in (G) of R 299.49 Footnotes for Generic Cleanup Criteria Tables.
(J) - Hazardous substance may be present in several isomer forms
(Q) - Criteria for carcinogenic polycyclic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene
(S) - Criterion defaults to the hazardous substance-specific water solubility limit.
(DD) - Hazardous substance causes developmental effects
(FF) - The acceptable air concentration (AAC) for the volatile hazardous substance are based on toxicity values that have been identified to have the potential to cause adverse human health effects for less than chronic exposures
(JT) - Hazardous substance may be present in several isomer forms. The VIAP Screening level may be used for the individual isomer provided that it is the sole isomer detected.

Property Boundary, typ.
Boundary as shown will be described by a Surveyor (SDA) as a legal description with POB and containing total acreage.

Proposed Underground Detention System (UDS)

Connectivity:
• Areas not collected by bio-retention will be directed to catch basins and a collection system of storm sewers throughout the site and directed to the proposed Underground Detention System (UDS).

Discharge:
• Storm runoff will be delivered to the proposed UDS, and will be discharged into the existing sewer, meeting the City of Detroit and DWSD standards

APPENDIX B
LABORATORY REPORTS AND CHAIN OF CUSTODY FORMS

Monday, December 09, 2019

Fibertec Project Number: 93877
Project Identification: DDOT Coolidge /
Submittal Date: 11/22/2019

Mr. Dan McNeely
DLZ Michigan, Inc. - Lansing
1425 Keystone Avenue
Lansing, MI 48911

Dear Mr. McNeely,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note TO-15 samples will be disposed of 7 calendar days after the reporting date. All other samples will be disposed of 30 days after the reporting date.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

By Sharon Rakow at 3:13 PM, Dec 09, 2019

For Daryl P. Strandbergh
Laboratory Director

Analytical Laboratory Report
Laboratory Project Number: 93877
Laboratory Sample Number: 93877-002

Order: 93877
Page: 9 of 189
Date: 12/09/19

Client Identification: DLZ Michigan, Inc. - Lansing	Sample Description: SB-01 (3-4)	Chain of Custody: 183699
Client Project Name: DDOT Coolidge	Sample No:	Collect Date: 11/21/19
Client Project No: NA	Sample Matrix: Soil/Solid	Collect Time: 08:00

Sample Comments: **Soil results have been calculated and reported on a dry weight basis unless otherwise noted.**

Definitions: Q: Qualifier (see definitions at end of report) NA: Not Applicable ‡: Parameter not included in NELAC Scope of Analysis.

Volatile Organic Compounds (VOCs) by GC/MS, 5035
Method: EPA 5035A/EPA 8260D

Aliquot ID: **93877-002A** Matrix: **Soil/Solid**
Description: **SB-01 (3-4)**
